These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 3½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,324 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia.

331f

## LAP—WELDED WROUGHT IRON TUBES

FOR

## TUBULAR BOILERS,

FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,

Dec. 25, 1y\*

Maryland.

### ENGINEERS' AND SURVEYERS'

### INSTRUMENTS MADE BY EDMUND DRAPER,

Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.

THE SUBSCRIBER has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

Vine St. Wharf, Philadelphia.

12f

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

321y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.		CHAINS.		STRENGTH	
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.	Tons.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.	LBS.	INCH.		
11	4½	13 5	10	24 -	50	15-16	20	
13	3½	8 3	8½	16 -	27	11-16	13½	
14	3½	6 11	7½	12 8	17	9-16	10½	
15	2½	5 2	6½	9 4	13½	1-2	7½	
16	2½	4 3	6	8 8	10½	7-16	7	

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## RAILROAD SCALES.—THE ATTEN-

tion of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,  
59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,  
Jan. 2. [1tf] 68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot, Jamaica November 12, 1845.

[Signed,] JOHN LEACH,

Supt. Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
45 N. E. cor. 12th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,  
No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10tf

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46tf

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**M**ANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion.

Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**K**EARNEY FIRE BRICK. F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE

Tyres imported to order and constantly on hand

A. & G. RALSTON

Mar. 20th

4 South Front St., Philadelphia.

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**T**O RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

PASCAL IRON WORKS.

## WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture! and for sale by

MORRIS TASKER & MORRIS,  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

## PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL &amp; CO.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
1y10 New York.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron only*. Address

SAM'L KIMBER & CO.,  
41f Willow Street Wharf,  
Philadelphia, Pa.

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
261f Philadelphia.  
ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
1y Albany Iron and Nail Works,

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 1½ to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,  
12 Platt street, New York.  
JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 281f

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**CONCORD RAILROAD.—PASSENGER**  
Trains in connection with the Lowell & Nashua Railroads, run daily between

Concord and Boston, Sundays excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

261f N. G. UPHAM, Sup't.

**NEW YORK AND ERIE RAILROAD LINE**  
SUMMER ARRANGEMENT. For passengers, twice each way daily, (except Sunday,) leave New York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M. Fare between New York and Otisville, \$1 50; way-fare in proportion.

For MILK—Leave Otisville at 5½ o'clock, morning and evening.  
For FREIGHT—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½ A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For farther particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

241f H. C. SEYMOUR, Sup't.

**WESTERN RAILROAD.—ON AND AFTER** Monday, April 5, 1847, the passenger trains will leave daily. Sundays excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.  
Albany at 7 1-4 a. m. and 5 p. m. for Boston.  
Springfield at 8 1-2 a. m. and 1 p. m. for Albany.  
Springfield at 8 1-3 a. m. and 1 1-2 and 3 p. m. (or on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a. m., and arrives in New York at 7 p. m., by the steamboats Traveler, New York, or Champion. Returning, leaves New York at 6 1-4 a. m., and arrives in Boston at 7 p. m.

Night line to New York.—Leaves Boston at 4 p. m., and arrives in New York at 5 a. m.

Albany and Troy.—Leave Boston at 8 a. m., Springfield at 1 p. m., and arrive in Albany at 6 p. m.; or, leave Boston at 4 p. m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p. m.

The Troy trains connect at Greenbush.

The trains for Buffalo leave at 7½ a.m. and 7 p.m. For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 8 1-4 a.m., 1 and 3 p.m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Sup't and Eng'r.  
C. A. SEAD, Agent, 27 State street, Boston.

**BOSTON AND PROVIDENCE RAILROAD.** Passenger Notice. Summer Arrangement. On and after Monday, April 5, 1847, the Passenger Trains will run as follows:

Steamboat train via Stonington—Leaves Boston every day, except Sunday, at 5 o'clock p.m.

Accommodation Trains—leave Boston at 7 and 10½ a.m. and 4 p.m., and Providence at 7½ and 10½ a.m. and 4½ p.m.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### Elevated Railway and Promenade

*Above the Omnibuses, in Broadway, New York.*

By the invitation of John Randel, Jr. C. E., (the gentleman who laid out the city of New York into streets and avenues in 1808 to 1820) we have had the pleasure of examining a model made by him in accordance with a resolution of the corporation of that city, who unanimously approved of the plan then proposed, representing several different plans for an elevated railway and promenade, through and above Broadway, from the Battery to Union Place. The cars are to be propelled by stationary power, with an endless rope, and pass above the level of the omnibuses and highest loads, and will not obstruct the present ordinary travel of the street or sidewalks.—The cars do not stop to take in or let out passengers—this is done by means of a tender, running upon another track, along side of the main track. Passengers may walk or be elevated from the pavement up to the promenade and railway.

This model is made entirely of metal—it is more than 31 feet in length, and has cost over \$3000, besides nearly two years of Mr. Randel's time in planning and superintending the work.

We intend, in our next number, to give a detailed description of this very elegant and important improvement for Broadway—and now call public attention to the subject, because a heavy expense is being incurred by the citizens for *awning posts* in Broadway; and any one of these plans of Mr. Randel, if adopted, which we think it will be, will supply that street with elegant *iron columns*, with capitals and fluted, and placed at regular distances apart, along the curb stones, and which may be used for *gas, awning posts, hydrants*, etc., as well as to support

this elevated railway and promenade, the whole length of Broadway, making together two rows of columns each about three miles in length.

Mr. Randel intends to take this model to N. York next week—and after it has remained there a short time, it is to be taken to London, where a patent has been secured.

### From New York to Pittsburg by Railroad.

We have a letter, says the editor of the Pittsburg Gazette, from an intelligent gentleman in New York city, and one who has the interest of the New York and Erie railroad much at heart, which says:

"There is no doubt we shall connect the Erie railroad with Pittsburg at an early day, though just now our entire energies are absorbed in completing the road to its New York terminus."

We have, in nearly all the letters we have written to New York city for three months past, pressed the importance of a communication like this upon the attention of our friends. The plan is entirely a practical one, and if the people on the line between New York and the Ohio river will heartily unite to accomplish the enterprise, it can be effected. If the Allegheny river is not to be improved by a Slack-water navigation, a railroad communication is doubly desirable. We do not expect to see either work accomplished at once, but we direct public attention to it as an event certainly to be realized unless Rip Van Winkle has seized fast hold on the most intelligent perceptions of the people. Providence has done so much for us in this section of country, that we find half the work done at our hands whenever any great public improvement is seriously commenced.

### The Iron Trade.

The Gloucestershire Chronicle says this trade is still without change in Wales, though reports begin to be heard that contracts for railway iron could be taken at lower rates, if for execution in the latter part of the present year. In the Clyde pig iron was considerably depressed in value in the course of the last week, but the effect of any orders received by the Caledonia for the American market has not yet been fully ascertained.

Glasgow, June 25.—The market has just now improved, and we may quote 64s. 6d. for No. 3, 65s. 6d. for 3-5 No. 1, and 2-5 No. 3, and 67s. for No. 1 cash, with little iron offering at these rates.

Birmingham June 26.—From what has transpired in Birmingham and Wolverhampton it is not probable that there will be any change in the price of

iron at the approaching iron masters' quarter days. The demand is still good.

### The Railroad West.

We understand that a meeting was recently held in Beaver, to take preliminary steps towards a railroad west. It was called in harmony with a meeting lately held in Salem, where \$1000 was subscribed towards the survey of the best route west from Pittsburg. Several gentlemen are in Pittsburg from Salem, in behalf of the enterprise, and we hope that, through the Board of Trade, or otherwise, it may receive an impetus from the citizens of that place.

### Railroad Cars.

The question has been asked us—how many cars—passenger and freight—are there in use on the American railroads? Not being able to answer it, we ask of each company a report on the subject.

### Tunnelling on Railroads and Canals.

We have received the following communication from an esteemed friend who has, it will be perceived, investigated the subject with some care; and we hope he will follow it up with his usual industry and perseverance, as the subject will then be better understood.

### For the American Railroad Journal.

The agitation attending the question of the proper route to be selected for the Pennsylvania railway has led to much discussion respecting *Tunnelling*. There appears to be a prejudice in the public mind in this country against tunnels. The reverse is the case in England. Engineers in Great Britain believe that the first cost of tunnelling bears no proportion to the ultimate advantages gained by shortening distance, lowering elevations and gradients, keeping nearer to a direct line, and avoiding curves—lessening deep cutting and filling, and, above all, establishing a permanent, everlasting roadway. I am aware that the accumulation of capital in England changes the question greatly; yet even here, when an object commensurate with the expense is to be obtained, every adequate outlay should be made.

The public in this country are not aware of the stupendous works of this nature which are proposed, and have been constructed in Europe. I give you a list below of a few in this country and Europe; hoping that it may induce some one who has more extensive means of research than I, to notice the subject, and furnish us with an account of all the important works of this kind.

† No returns from this, excepting that the total cost of construction, repairs, and running expenses was \$14,557 56, and the receipts from all sources \$17,158 29.

\* The columns, the headings of which are in *Italics*, are calculations made from the data furnished in the reports. The \* is put where there were no returns made.

#### Improved Tubing—Electric Telegraph.

The London Railway Record says "Our attention has been called to some important improvements recently made in the patent welded iron tubing, by Mr. Cornelius Whitehouse, of the Globe tube works, Wednesbury, the original patentee. These improvements, we are assured by a friend, who has had much practical experience, placed Mr. Whitehouse's manufacture at the head of all inventions of a like character. For the electric telegraph this tubing is peculiarly applicable."

#### Railway Traffic in England.

From the official returns it appears that the amount of traffic for the week ending June 19th, on upwards of 2,730 miles of railway, was £178,004, thus accounted for: £100,181 for the conveyance of passengers only, £40,814 for the carriage of goods, and a remainder of £37,009 for passengers and goods together, not respectively apportioned; being an increase of £5,339 over the corresponding week of last year, when the mileage was about 2,292.

The amount of traffic for the week ending June 26th, on upwards of 2,730 miles of railway, was £162,922, thus accounted for: £89,339 for the conveyance of passengers only, £41,868 for the carriage of goods, and a remainder of £31,815 for passengers and goods together, not respectively apportioned; being an increase of £13,470 over the corresponding week of last year, when the mileage was about 2,292.

The amount of traffic for the week ending July 3d, on upwards of 2,730 miles of railway, was £173,506, thus accounted for: £98,252 for the conveyance of passengers only, £39,636 for the carriage of goods, and a remainder of £35,618 for passengers and goods together, not respectively apportioned; being an increase of £19,691 over the corresponding week of last year, when the mileage was about 2,292.

#### Georgia Railroad and Banking Company.

We give the Annual Report of the President and Engineer of this Company nearly entire—and thus keep up the series.

#### PRESIDENT'S REPORT.

#### To the Stockholders of the Georgia Railroad and Banking Company.

The annexed statement of the cashier, compared with last annual statement, will exhibit the operations of the bank during the past year. As was anticipated in the last annual report, these operations have been considerably enlarged, though the full advantages of this branch of the institution can never be realized while it is charged with so heavy an interest on the debt contracted for the construction of the road.

It will be seen by the engineer's report that the net profits of the past year, ending March 31st, were.....\$252,033 10

For the same time the interest paid by the bank was.....\$54,761 56  
Reduced by interest, discount, etc, received.....25,971 86

Balance of interest.....29,389 70  
Add bank salaries, taxes and incidentals.....10,218 81

39,708 51

Leaving nett.....\$212,324 59

Or upwards of 9 per cent. on the capital stock, after paying interest on debt, and all expenses properly chargeable to both bank and road. It has been truly observed by the engineer in his report, that the past has been a year of great prosperity; but as the tendency is to an increase of net profits, from causes noticed in previous reports, and as our connections will soon be considerably extended, the directors see no reason to anticipate any diminution of the net profits of the company hereafter.

In connection with this result of the last year's business, the directors feel it a duty to remind the stockholders of the real value and prospective profits of their stock. It will be perceived that if that part of the road debt

bearing interest were represented by capital stock, the whole investment would yield an interest that would insure to the stock a heavy premium in the market.

The engineer's report exhibits fully the present condition of the road, and its operations for the past year. The outlay for cars and engines has been somewhat larger than was anticipated, owing to an increase of business and other causes mentioned in his report. As these causes are mostly flattering to the business and prospects of the company, they afford no discouragement to the stockholders; and with the trifling exceptions mentioned by the engineer, the outlay hereafter may be confined to the regular and necessary expenses of working the road, and such gradual appropriations as may be deemed expedient to replace the flat bar with heavy iron to Union Point. This latter outlay, though very important, is of no pressing emergency, except for the first 20 miles. The plate rail is a good one, and it is believed by the directors, that few roads in the Union laid with a plate rail are in better condition, or kept in a more perfect state of adjustment than our road from Augusta to Union Point. This pattern of rail is however not well suited to our heavy business, and as the same trains run over the entire road, much of the advantage of a heavy rail above Union Point is lost by the use of the plate rail below it.

These considerations might well induce the directors, on principles of true economy, to recommend at once the substitution of a heavy rail to Union Point, if the finances of the company were in a condition to warrant it. As they are not, however, the orders made, or at present contemplated by the engineer, have been very properly confined to the 20 miles nearest Augusta. To this extent the purchase of the heavy rail during the present year is especially important. It is the oldest part of the road—is more used than any other, and while the heaviest tonnage necessarily passes over it, it exhibits some of the largest and heaviest grades upon the line.—To these inducements may be superadded, the very favorable opportunity of disposing of the plate rails to be displaced.

The growing importance of the trade and travel from the valley of the Coosa and North Alabama, induced the board to authorize a subscription, to about one-fourth the stock of the road, chartered from Kingston to Rome, which is estimated at a cost of not exceeding one hundred thousand dollars, including necessary outfit. The small departure from the acknowledged policy of the company, was thought by the directors to be well justified by the importance of the object, compared with the small outlay which was found to be necessary to accomplish it.

The directors are pleased to notice the confidence with which the engineer anticipates a continuation of the line from Cross Plains to Chattanooga, and from that point to Nashville. It is with equal pleasure they have understood that the Hiwassee company has been revived, with a strong prospect of the completion of the road at an early day. The great resources of the country to be devel-

oped by these important roads connecting with our Georgia improvements, have been often noticed and never overrated. When completed, it would be difficult to estimate the business that must crowd upon us from the populous and fertile regions of East Tennessee, and the great valley of the west.

In pursuance of the policy indicated by the stockholders at the last convention, the directors have since that time declared from the net profits, two dividends of two dollars each, amounting in the aggregate to \$91,567 99. About \$31,000 of the principal debt bearing interest has also been paid. The heavy outlay made by the engineer for outfit and the purchase of new iron, has weakened the ability of the company to pay as much towards its principal debt as was desirable. Something more, however, could have been paid with safety, if any opportunity had been afforded. This opportunity will be afforded on the 1st of July next, when a portion of the funded debt of the company will become due, and may be further reduced.

All of which is respectfully submitted,  
JOHN P. KING, *President.*  
Augusta, May 11, 1847.

We give annexed the Engineers Report of the proceedings of the past year. It makes a good exhibit of the affairs of this well managed company.

#### ENGINEER'S REPORT.

*Engineer Department G. R. R. & B. Co. }*  
Augusta, Ga., April 19, 1847. *}*

SIR: Since my last annual report, there has been expended for the road as follows:

For real estate, right of way, division houses, depots, finishing bridges, etc.....	\$22,987 45
For additions to our stock of locomotives 35,391 93	
"      "      "      cars.....	29,550 00
For new iron rails and fastenings not laid down.....	6,194 13
	<b>\$94,123 51</b>

All balances of consequence due on account of the extension of the road beyond Madison, have been paid. It being the true policy of the company to substitute for the plate rail on the road beyond Union Point, a heavy rail, as fast as a favorable disposition can be made of the old material; 700 tons of iron of the  $\Pi$  form, weighing 46 lbs. per yd. have been ordered to relay that part of the road between Augusta and Belair.

In expectation of a large increase in our business, from the extension of the State railroad to Cross Plains (Dalton) and the completion of the branch to Rome, I have ordered 20 additional close freight cars to be built in time for the ensuing crop. These will cost about \$12,000. The present stock of the company consists of 149 close 8-wheel freight and stock cars, 65 8-wheel platform cars, 8 8-wheel passenger cars, 3 8-wheel baggage and mail cars, and 5 4-wheel passenger cars.

The addition of another 8-wheel passenger engine, which will cost, delivered, \$7,500 will make our motive power equal to the present wants of the company. In consequence of a deficiency in this branch of the service during the early part of the past business season, together with the necessity we

were under of loaning to the State the use of some of our engines—owing to the delay in the arrival of hers, and the unexpected increase in the grain transportation from the Cherokee region—the repairs of the locomotives are somewhat greater than usual; the causes referred to rendering it necessary to keep a larger portion of our engines on the road at one time than usual, which was necessarily followed by a resort to night work for their repair—always expensive and unsatisfactory in its results.

For the purpose of accommodating our increased number of locomotives, a new house calculated to contain 16 engines has been commenced, and will be finished during the fall—the car factory having already been removed to the back part of the lot, to make room for its erection.

Horse power upon the Athens branch has been discontinued, and a small locomotive weighing 336 tons substituted instead, which performs the duty required satisfactorily, and without material injury to the road. The following summary statement will exhibit the result of the operations for the year ending March 31st, 1847.

BUSINESS.	
Passengers.....	\$136,559 69
Freight.....	232,891 24
U. S. Mails, etc.....	40,484 53
	<b>\$409,935 46</b>
EXPENSES.	
Conducting transportation.....	\$36,933 75
Motive power.....	45,066 08
Maintenance of way.....	57,508 29
"      cars.....	18,394 24
	<b>157,902 36</b>
Leaving net profits of the road.....	<b>\$252,033 10</b>

The receipts of the road exceed those of last year \$94,593 87, and the expenses \$21,698 62. It will be recollected, however, that 40 miles of the road were not brought into use until nearly six months of the previous year had elapsed. The increase in the receipts is, from passengers \$42,498 61; up freight, \$10,244 25; down freight, \$39,401, and mails, \$2,450 01. The whole number of bales of cotton transported over the road was 94,867, showing an increase of 30,076 bales. The average number of passengers per day carried both ways, is 92, against 66 last year. Of the first number there were 12 entered through between Montgomery and Charleston, against 10 the previous year.

The whole number of passengers transported over the road is 33,354. The distance travelled by them is equal to 2,853,637 passengers carried one mile; which will make the cost of carrying each, 2 05 cents per mile. The freight is equal to 4,966,767 tons carried one mile, giving the cost of carrying each ton  $1\frac{1}{2}$  cents per mile.

Comparing the expense with the distance run by all the trains, we have the following results for four successive years.

	1844.	1845.	1846.	1847.
Conducting transportation per mile run.....	17-50	16-50	13-9	14-25
Motive power, do.....	16-75	14-75	16-1	17-40
Maintenance of cars.....	6-75	8-25	6-6	7-10
"      way.....	25-00	23-00	22-7	22-20
Totals.....cents,	66-00	62-5	60-3	60-95

The average cost of the repairs of the road is a trifle less than 270 dollars per mile, and, contrary to our expectations, less than it was last year, which fully exhibits the judgment and fidelity that have characterized the administration of that department.

The transportation department has been particularly fortunate in the regularity and freedom from serious accidents, that have attended the business operations of the year, reflecting the highest credit upon its courteous and efficient superintendent.

In reviewing the operations of the road, for the past year, we think that the stockholders have every reason to congratulate themselves with the result. We have done a fair business, at extremely low rates. On produce, for the whole length of our road—171 miles—our charges were but from 16 to 25 cents per 100 lbs. Yet we have been able to clear, after paying all expenses, including interest, over 9 per cent. upon the capital stock. It is true that this has been a year of general prosperity; but it will at the same time be recollected, that we penetrate through the W. & A. railroad, a country whose resources are scarcely at all developed, and that road has not yet reached a point whence we could expect it to draw much new transportation. Thus far, however, it has more than realized our expectations, and fully justified the enlightened policy of this company, in extending pecuniary facilities towards its construction.

The future success of that project (W. & A. R. R.) may now be considered as fully demonstrated. If continued no farther than Dalton (Cross Plains) it will be a valuable improvement: but when carried to the Tennessee river, according to the original design its revenues, after paying expenses, will greatly diminish, if not entirely relieve the State from taxation on account of the debt incurred for its construction. The sum necessary to finish the remainder of this road, and stock it with the necessary locomotives, will not, under the economical administration of its present chief engineer, exceed \$375,000.—The interest upon this sum at 6 per cent. is but \$22,500, while the revenues the first year, I hesitate not to say, will be augmented fully \$75,000, and will continually increase, as the mineral and agricultural resources of the vast region that will then become tributary to the road, are developed—independently of the flood of business that will follow the completion of the Nashville road, the construction of which is no longer problematical.

From the southwest, we find our travel gradually but constantly increasing. The extension of the Montgomery road will still further augment this source of our revenue, which would be greatly increased by the union of the roads. In fact, on all sides we can see nothing but cheering evidences of success, with but little to mar the prosperity before us.

All of which is respectfully submitted by your obedient servant,

JOHN EDGAR THOMSON,  
*Chief Engineer.*

#### Susquehanna Railroad.

##### Extension from York to Harrisburg.

This is a subject to which we have often referred and to which we have attached much importance—we therefore republish the following report of a committee appointed to investigate, and report upon, the subject. It is quite true that energetic movements were made for the opening of this road, and we are therefore pleased to learn that the Baltimore and Susquehanna railroad company have taken the measure in hand. When the work is once commenced, it will not be long before it is extended northward to the New York line—thus opening a communication from Baltimore to the interior of New York.

The undersigned, a committee appointed by the Board of Directors of the Baltimore and Susquehanna railroad company upon the subject of a railroad connection between York and Harrisburg, by means of the charter granted by the Legislature of Pennsylvania to the York and Cumberland railroad company, beg leave to submit to the board the following

#### REPORT.

The committee left Baltimore on the second day of June, accompanied by Isaac R. Trimble, Esq., the former engineer of the company, who had been invited to accompany them. From that day to the fifth, they were engaged in visiting York, Harrisburg, and Middletown, for the purpose of making a reconnaissance of the intermediate country, and of obtaining information as to the feasibility and probable cost of the proposed road. They found the best feelings upon the subject existing on the part of the citizens of the various towns they visited, and an earnest desire to lend their efforts towards the immediate prosecution of the undertaking. Assur-

ances were given by many that stock would be liberally subscribed for. Nothing like a feeling of state jealousy seemed to exist, but all appeared anxious for the proposed railroad connection with Baltimore—very properly considering that it would be productive of equal advantages to Pennsylvania and Maryland. It would more fully develop the agricultural and mineral resources of the former, by affording a market in the latter, thereby adding to the commerce and wealth of both.

The act to incorporate the York and Cumberland Railroad Company was passed by the Legislature of Pennsylvania in the month of April, 1846. By said act the company are empowered to construct "a railroad from the borough of York to unite with the Cumberland Valley Railroad, at some point between Mechanicsburg and the Susquehanna river." The capital stock of the company is limited to 60,000 shares of \$25 each; the person subscribing for the same to pay at the time one dollar on each share taken. When 3000 shares shall have been taken, and the fact duly certified to the Governor of Pennsylvania, he shall, "by letters patent, under his hand and the seal of the commonwealth, create and erect the subscribers, together with those who may afterwards subscribe, in a body politic and corporate, in deed and in law, by the name, style and title of the York and Cumberland Railroad Company, and by that name to have perpetual succession, etc. It is further provided, that, "if the said company do not complete the said work, so as to bring it into use, within five years after the passage of this act, then this charter shall become null and void." For further details this board are respectfully referred to the charter itself.

Though the road to be constructed under this charter will be within the limits of the State of Pennsylvania, yet it is our own State that is most deeply interested in its completion. By this means, her large investment, and that of the city of Baltimore, in the Baltimore and Susquehanna Railroad, may soon be made profitable; while the vast amount of trade which would be attracted to our city, would add a new and important item to the sources of her commercial prosperity. Though many enterprising citizens of Pennsylvania are ready to embark their capital in the undertaking, yet they naturally look to Baltimore for the first movement and principal aid. They look especially to this company—as the party most immediately interested,—to take the lead, by proposing some definite and concerted action, upon the subject. The question then presents itself, shall the work now be started, or shall the charter heretofore granted be suffered to expire by its own limitation?

Before answering this question, the committee propose to consider—

#### 1.—COST OF CONSTRUCTING THE ROAD.

This, according to the estimate of the able engineer, Mr. Trimble, would be about \$500,000.

The committee themselves made a careful observation of two of the routes which have

been proposed, viz:—One from York down the Codorus creek to its mouth, thence up Susquehanna river, along, or near its banks, to the Cumberland Valley railroad, at the bridge opposite Harrisburg. The other route would leave the Codorus about a mile below York, and running in a northern direction, strike the Susquehanna at York Haven, about five miles above the mouth of the Codorus. Neither of these routes would exceed twenty-nine miles in length: and by far the greater portion of both, lying along the banks of the Susquehanna, is remarkably free from difficulties, presenting one of the easiest and cheapest rail routes in the country.

The object of the committee being, not to decide which would be the best location for the road, but only to ascertain that at least one practicable route existed, they did not examine others to which their attention was invited. It is proper, however, to state that the opinion is entertained by some of the citizens of York county, that a favorable route for the road may be found by running from York north-westwardly, through, or near Lewisburg, and intersecting the Cumberland Valley railroad some four or five miles west of the Susquehanna. Before the road is finally located, all the country over which the charter authorizes it to be constructed, should, of course, be carefully examined, and that route selected which, under all circumstances, offers the greatest advantages.

For further information on this branch of the subject, we refer the Board to the communication of Mr. Trimble, presented with this report.

#### II.—THE PROBABLE AMOUNT OF THE BUSINESS OF THE ROAD.

At whatever point the road from York may unite with the Cumberland Valley railroad, the connexion between York and Harrisburg will be complete, inasmuch as the Cumberland Valley road unites with the Harrisburg and Lancaster railroad, near the canal basin at Harrisburg. Baltimore would thus have a continuous and most desirable connexion with all the principal lines of the Pennsylvania improvements. The Cumberland Valley and the Franklin railroads extend from Hagerstown in Maryland, to Harrisburg, a distance of upwards of seventy miles, through the Cumberland Valley, one of the most populous and fertile regions of America. Some idea may be formed of the value of the annual products of this valley from the statistics furnished by the census of 1840. The following table shows the aggregate of some of the principal products and manufactures for that year, of the six counties of Bedford, Franklin, Cumberland, Dauphin, York, and Adams—and also the whole amount of the same products and manufactures for that year, of the State of Maryland:

Six counties of Pa.		Maryland.
Wheat—bushels.....	2,458,312	3,345,783
Rye do .....	1,413,863	723,577
Oats do .....	3,139,401	3,534,211
Corn do .....	2,958,104	8,233,066
Distilled and fermented—		
Liquors—gallons.....	1,043,697	366,213

For the products of these six counties—

nearly equal to those of our entire State.—Baltimore is the nearest and natural market. Large quantities are now sent from some of these counties, by wagons, to York, hence to be sent by railroad to Baltimore; but far the greater proportion, attracted by superior facilities of communication, is carried to Philadelphia. By constructing the proposed road, we would bring the rich granaries of this region within a few hours' travel of Baltimore, and might reasonably expect to secure almost the whole of this trade.

The committee have been furnished with a statement of the business of the Cumberland Valley railroad, by which it appears that the transportation over that road for the year 1846 amount to 45,453,990 lbs, and for five months of the year 1847, to 32,287,158 lbs.

Besides the Cumberland Valley railroad, the Pennsylvania canal would also meet us at Harrisburg. This immense work, extending through the heart of Pennsylvania, connects the waters of the Susquehanna with those of the Ohio and Lake Erie. Its length, (including the Portage railroad of 36 miles,) from Harrisburg to Pittsburg is 284½ miles, and from Beaver to Lake Erie 116 miles; total 420½ miles. But besides the main line, branches of this canal have been extended into various sections of the State. One of these extends from Duncan's Island, at the mouth of the Juniata, up the Susquehanna to Northumberland, a distance of 39 miles. At this point two other branches start; one running with the north branch of the Susquehanna 73 miles, to Lackawannock, the other with the west branch 72 miles, to Dunstown. The latter branch of the canal is met at Williamsport by a railroad, the greater portion of which is finished, extending from Elmira in New York. Elmira connects by canal with the most important lines of improvements of that State; and a railroad of but 30 miles in length is wanting to connect Williamsport with the great New York and Erie railroad, now in progress of construction. These various branches of the canal pierce the rich counties of Dauphin, Perry, Juniata, Union, Columbia, Northumberland, Luzerne, Bradford, and Lycoming,—abounding in lumber, iron, and grain, and containing some of the most extensive and valuable coal fields in the world.

Between York and Harrisburg, on the east bank of the Susquehanna, is Middletown, the greatest lumber market perhaps in the country. The following estimate of the number of feet brought down the river annually to this point, has been furnished by a gentleman of York, who has given considerable attention to the subject:

Boards—300,000,000 feet board measure,	\$3,000,000
Timber—150,000,000 do do	1,500,000

Total value of annual trade ..... \$4,500,000

Both of the routes for the York and Cumberland railroad, which were examined by the committee, pass up the river immediately opposite this place, and could be connected with it by a bridge of one mile in length. The privilege of bridging the river at this point was not granted in the present charter,

but no doubt could be hereafter obtained. Besides serving to bring this valuable trade upon the railroad, a bridge here would be of great advantage to the neighboring country; and, as a toll bridge would nearly pay the interest upon the cost of its construction.

It will be found by reference to the census statistics of 1840, that two-thirds of the iron manufactured in Pennsylvania is made in the counties west of the Susquehanna. Should the proposed road be made, Baltimore will be the most convenient market for this trade, and cannot fail to receive a large proportion of it.

But the source from which this road would ultimately realize its largest profits, is the COAL TRADE. In the upper part of Dauphin county, and near the Susquehanna river, are the Lyken's Valley, Berry's Mountain, Bear Valley, and Stoney Creek coal basins—the three first anthracite, the last bituminous. The coal of this region in quality has no superior. In quantity it is inexhaustible. The report of an intelligent committee, who had visited these basins, made to the Legislature of Pennsylvania in 1839, estimates that Bear Valley basin alone contains 658,240,000 tons; while some have estimated its deposits as high as 4,000,000,000 of tons! If the York and Cumberland railroad be made to Harrisburg, the day will not be distant when it will be extended into the heart of these coal basins. From Harrisburg to Dauphin town or Port Lyon, at the mouth of Stony Creek, is 8 miles; from thence to the bituminous coal beds of Stoney Creek Valley, is 13 miles. From Dauphin town to the anthracite coal beds of Berry's Mountain is a distance of 29 miles. The whole distance from Baltimore to the bituminous coal basin of Stony Creek, would be only 108 miles; to the anthracite coal fields of Berry's Mountain 124 miles,—the former a shorter route than that of the Schuylkill coal sent to Philadelphia by the Reading railroad. Coal could be delivered by this route in Baltimore much cheaper than it can be supplied by any existing or proposed route from any fields yet discovered. Canal and railroad connexions already exist between Harrisburg and these coal basins—and considerable quantities have been brought into the market. But the completion of the York and Cumberland road would give a new impetus to this trade, by affording it a shorter and cheaper avenue to the waters of the Chesapeake.

We have thus far been considering the probable business of the York and Cumberland railroad, if dependent solely upon the trade of Pennsylvania. But another great enterprise has been commenced, which, when completed, must ensure to this road an amount of business that will make it one of the most profitable railroads in the Union. The charter for the Pennsylvania Central road, to extend from Harrisburg to Pittsburg, was granted in February, 1846. The importance of this road to the trade of Philadelphia has called forth the most zealous efforts of her citizens to hasten its completion. Three millions of stock, or nearly half the amount required, have already been taken; and sec-

tions of the road are about to be put under contract.

The length of the road from Harrisburg to Pittsburg will be 228 miles, and its estimated cost is something over \$7,000,000—or about \$31,000 per mile. Philadelphia has already a railroad connection with Harrisburg by a route of 106½ miles. By finishing the Central road, she will have a continuous railroad connexion with the waters of the Ohio at Pittsburg, by a route of 334½ miles. Can it be doubted that this connexion will be speedily made?

To be continued.

#### Rust.

All the common metals, except tin, rust; they become duller and duller up to a certain degree, lose gradually their lustre, and then the process goes no further. Instead of this rusting being a destroyer of the metal, it is a preserver; for, even in the case of iron, which rusts quickly as compared with other metals, if it be dipped into tin, it comes out coated with it, and it is preserved beautifully. If iron be exposed for a couple of hours to the action of water, the iron becomes quite corroded; but when tinned, the iron is protected, and the tin itself appears unaffected. How is it that this metal can protect itself, and the iron under it? It is simply owing to the substance formed on the surface by the attraction of oxygen, which is so adherent to the metal beneath. It gives a protection which no varnish or any kind of application can afford. Take a copper or a tin plate, they are both protected in their metallic state by a thin coat, formed in the first instance, of oxide. It is only because this coat is so exceedingly compact, close, and adherent, that it passes for nothing—a mere film of tarnish. You think you see, or touch, a piece of tin; you cannot detect the film, except by close examination. We know it is there, but it is only by optical phenomena that we can measure its thickness. It seems clean and beautiful, but if you rub it off, you will give the metal beneath a new character; the beautiful lustre, however, passes off the first moment up to a certain point. The body formed by the combination of oxygen with iron is different. The oxide does not adhere to the metal beneath; it forms upon it little spots, or porous tumuli. It is not an investing varnish, but the process goes on through the pores of the rust, especially if the metal be placed in a damp atmosphere. This is the reason why we find a difference between copper, iron, tin, and lead, when used for roofs, or other external purposes. The iron alone is eaten into and destroyed, by this want of adhesion in its rust to the surface of the metal. "It is curious to observe, in some cases, how tin, a metal having a slight attraction for oxygen, protects other metals from oxidation. In Canada, tin plate is used for the roofs of houses; I am told that you are dazzled by the attraction of the setting sun upon the roofs of houses; and there, although it is exposed to the atmosphere year after year, it does not decay, because the superficial coat of oxide protects the tin and iron beneath."—Faraday.

## Institution of Civil Engineers.

June 8.—Sir J. Rennie, President, in the chair.—The paper read was "On the Expansive Action of Steam," by Mr. J. M. Heppel. The object of the paper was to deduce a more exact formula than those now in use for the dynamical effect developed by steam in expanding from one pressure to another. The usual method of computing this effect neglects the influence of the variation of temperature, which always accompanies change of density, and which has been shown to modify considerably the corresponding pressure. M. de Pambour, however, has, by combining Gay Lussac's formula for the relation between temperature and density under uniform pressure with that of Boyle for the relation between density and pressure under uniform temperature, deduced a formula containing the density, pressure and temperature from which any two being given the third may be deduced. What was further done in Mr. Heppel's paper, was to combine this formula with one by Mr. Scott Russell, expressing the relation between the pressure and temperature, and by this means to eliminate the latter, and obtain a formula containing only the pressure and density. From this formula another was easily obtained, showing the total dynamical action developed during expansion from one pressure to another, and the results were given in a tabular form exhibiting—1. The pressure in pounds per square inch. 2. The relative volume or ratio of the volume of steam to that of the water that produced it. 3. The dynamical effect before expansion, or the number of pounds raised one inch by the evaporation of each cubic inch of water. 4. The dynamical effect during expansion, or the number of pounds raised one inch by the steam produced from one cubic inch of water in expanding from a pressure of 100 pounds per square inch to the particular corresponding pressure. The dynamical effect in expanding from any one pressure to any other must be clearly expressed by the difference of the corresponding numbers in this column. Part of the remainder of the paper was devoted to showing that while the performance of engines could not possibly be expected to exceed the results ascertained as above, it should not fall far short of them in the case of engines of good construction. In conclusion, a simple method was suggested of ascertaining the magnitude of all the forces in action during the working of the Cornish engine, independently of the indicator. In the course of the paper, the fallacy of the theory of what had been termed the "percussive action of steam" was ably exposed, and although from the paper being full of mathematical formula, it was not adapted to be read at a public meeting, it evidently possessed great merit as an investigation of an important subject.

This paper was followed by a short one also, "On the Expansive Action of Steam," by Mr. Tate, mathematical master of the training college, Battersea. Its object was to demonstrate and apply a formula some time since discovered by the author, expressing the law of the expansion of steam, and at the

same time to establish certain general equations relative to the work of steam, applicable to all formula professing to give the law of volume and pressure. It also examined and corrected Pole's formula, which although a decided improvement upon Pambour's was stated not to be sufficiently accurate for pressures above 70 or below 18 pounds.

M. Piaget exhibited in the library, after the close of the meeting, specimens of his improvements in producing ornamental metal surfaces formed by the deposition of metals during the electrotype process, which is conducted in a peculiar manner with mixtures adapted to the effect desired to be attained. The form also of the bath is peculiar, and when the plate is taken out of it and off the model, it exhibits a burnished polish or a dead appearance according to the preparation used. The metal thus produced is stated to be of a much better description than metals which have not undergone such process, as it is more flexible, and is capable of withstanding the action of heat without destroying the form of the copper, and the surface will not tarnish when exposed to the air. Portions of any pattern can also be silvered by a similar process, and the general expense is about one-third of that of engraving or chasing, while the boldest or most minute patterns can be equally well produced.

June 15.—Sir J. Rennie in the chair.—The paper read was, "On the Law which Governs the discharge of Elastic Fluids under Pressure through Short Tubes and Orifices," by W. Froude. The subject of the paper admitted of a much longer communication than could be read at one meeting, and the train of reasoning was such as could scarcely be perfectly entered into on merely hearing it read. A short review of it must suffice. The law proposed was a modification of that which has been usually assumed viz: a simple application of that which holds good with respect to non-elastic fluids. This law is generally that the velocity of issue is directly as the square root of the pressure, and inversely as the square root of the density—but this law neglects wholly the re-action that must arise from the expansion necessarily taking place in the course of issue.

The nature of the action was illustrated by the following example: let a balance be supposed, with an equal weight in each scale, one of the weights being a spiral spring, like that of a spring balance, compressed lengthwise with its axis vertical, and held in a state of compression by a cord, now let the cord be suddenly reversed so that the spring is enabled to extend itself vertically. The scale in which it stands will obviously be depressed, the spring reacting on it as it expands upwards, and continuing to press till wholly relaxed; or if the scale in which it stands were ascending by a preponderance given to the other scale, the rate of its ascent would be in the same way retarded. The amount of the retardation would depend on the strength and weight of the spring, and on the length to which it would extend itself when released. Now in the discharge of an elastic fluid, there is an action, strictly analogous, operating con-

tinuously, however, instead of *per saltum*, the strength and weight of the spring being represented by the elasticity and density of the fluid, and the length to which it would extend itself by the degree of expansion, in the course of issue. The reduction in quantity of discharge due to the action was to be measured by the velocity imparted by expansion to each particle of the elastic fluid in course of issue, the velocity of each particle after expansion would be its velocity before expansion, multiplied into the rate of expansion, and the primary force must be subdivided in generating each additional unit of velocity, so that the portion applicable to the generation of velocity before expansion would be the whole force divided by the rate of expansion. Thus the velocity before expansion would be divided by the square root of that rate. For instance, an elastic fluid expanding four times in course of issue would be discharged with only half the velocity of a non-elastic fluid, under the same circumstances of pressure and density. This modification was shown to fulfil the general dynamical law, "that a given force acting for a given time will produce a given momentum, whatever be the weight of the mass acted upon." This seemed to be the essence of the law for non-elastic fluids; but it was disregarded by the unmodified application of that law to elastic fluids, in which there would be a great accession of velocity of particles issuing under a given pressure, without any reduction of quantity discharged in a given time. If, however, the quantity be reduced, as proposed, in the ratio of the square root of the density, and the velocity be accelerated in the same ratio, the final momentum would be the true equivalent of the pressure. This, in its practical application, explained what was inexplicable by the ordinary theory—the difficulty experienced from the back pressure of the waste steam in locomotive engines; and a diagram was given, showing that at 60 miles per hour this would be at the least equivalent to 8 lb. per inch throughout the stroke,—thus showing a loss of nearly 50 horse power. As applied in the case of air discharged into an exhausted receiver, the result was highly curious. The rate of discharge, instead of increasing throughout as the degree of vacuum was increased, would be maximum at 15 inches of vacuum, although nearly uniform for many inches above and below that point. It would, however, progressively decrease above that point, because the expansion would increase in a higher ratio than the pressure, and ultimately, at the point of perfect vacuum, it would be at a minimum, (indeed stationary, were air perfectly elastic,) because at that point the expansion would be infinite, but the pressure only finite, viz., 80 inches of mercury. Experiments made, by permission of Mr. Brunel, with the South Devon atmospheric apparatus, confirmed the theory. The line traced by an indicator apparatus was shown to accord very closely with one traced by this theory, whilst it was widely at variance with the result of the ordinary theory.

After the meeting, Mr. Lambert exhibited

his flexible diaphragm water valve, which was intended to remedy some of the defects of the plugcock. It avoided the leakage and necessity of repairs. There was apparently no friction, and it seemed very durable, and well calculated for the newly introduced system of constant pressure.

June 22.—Sir J. Rennie, President, in the chair.—The paper read was by Mr. J. Glynn, giving "An account of the plans that have been proposed for connecting the Atlantic and Pacific Oceans by a navigable canal." The author took a review of these projects from the time of Cortez, who proposed to cross the Isthmus of Tehuantepec by joining the waters of the river Coatzacoalcas, which flows into the gulf of Mexico, with those of the river Chicapa flowing into the Pacific, by the bay of Tehuantepec; a plan which has lately been revived by Don Jose de Garay, who, with the assistance of Signor Moro, surveyed the country from sea to sea, and showed that the chain of mountains is there broken for about thirty-five miles, giving place to an elevated plain or table land, called the Mesa de Tarifa, where both these rivers originate, and where their junction would be easily effected. The objections to this plan are the length of the river navigation, about 200 miles, and the ascent of the stream to the Mesa de Tarifa, about 200 metres, or 656 feet above the ocean. The survey was made under the patronage of the Mexican President, General Santa Anna, who professed to grant many important privileges to the promoters. The Isthmus of Nicaragua was next examined, and then the course of the river St. John to the lake, which is a little more than fifteen miles distant from the Pacific Ocean, and about 130 feet above its level. The distances and the levels were accurately taken by Mr. Bailey, an officer in the Royal Marines, by desire of General Marazon, President of the Central American Republic. The ridge of hills intervening between the lake and the ocean, and the uncertainty of the waters in the river St. John, alternately swollen by the rains or dried up by the heat of a tropical sun, the volcanic character of the country, and the unhealthy nature of the climate on this river, from which Lord Nelson's expedition suffered so much, render the execution of such an undertaking at this place very improbable. The Isthmus of Panama presents fewer obstacles than any other point. The distance from sea to sea is only about thirty-nine miles, and the country is traversed for nearly the whole width by the great rivers of Chagres and its tributaries, which are interlaced as it were with the streams flowing to the Pacific. The chain of mountains here sinks into extensive savannahs and forests, with a few detached and isolated hills, and small elevations seldom exceeding 500 feet in height. The country was surveyed in 1828, at the instance of General Bolivar, by Mr. Lloyd, an English officer, who also took the levels, and determined the difference between the two oceans to be 34 feet (352.) the waters of the Pacific being the highest. Mr. Lloyd's valuable papers, deposited with the

Royal Society and the Royal Geographical Society, were exhibited to illustrate the paper. A survey of the river Chagres was also made by order of the Admiralty, during which Capt. Foster, of her Majesty's ship *Chanticleer* lost his life. The maps, plans, sections, and other valuable information deposited with these societies seem to have created but little interest in England, but they have been diligently examined, and extracts and copies taken by foreigners who have had free access to them, especially by the French; and M. Guizot lately sent M. Napoleon Garella, as engineer-in-chief, with a numerous staff of assistants, to make a further survey, and ascertain the practicability of making a canal. This survey has fully confirmed that of Mr. Lloyd, and proves that there are no obstacles which engineers and contractors of the present day could not encounter and overcome without much difficulty or expense, the difficulties being more of a political character, and to be dealt with by statesmen rather than by engineers. The meeting was very fully attended, and an interesting discussion ensued, in which Prince Louis Napoleon took an active part. He traced a line between the lakes Nicaragua and Leon, which he recommended as preferable, on account of the local facilities, the salubrity of the climate, the already populated character of the country, and the advantages of the two lakes, which at a small expense may be converted into harbors accessible at all times for vessels of heavy tonnage. The plans proposed by his royal highness appeared to meet the views of the meeting, as far as a ship canal was concerned, but it was agreed that for quick transit by railway, the lines traced by Mr. Lloyd over the Isthmus of Panama were to be preferred.

#### Railway Accidents.

The way to avoid accidents is to know how they do and may occur.

#### Accident on the Great Western Railway.

—An accident attended with great loss of property, occurred on Friday morning on the Gt. Western railway, between the Chippenham and Wootton Bassett stations. It appears that a goods train, consisting of between thirty and forty trucks, containing merchandise and cattle, and propelled by two powerful engines, one of which was in the rear of the train, left the Chippenham station about one o'clock in the morning, and proceeded as far as the bottom of the inclined plane near Wootton Bassett station, when a chain, connecting the two parts of a timber wagon, broke, and the leading engine ran away with a few trucks and the fore part of that containing the timber. One end of the timber being thus left without support, immediately fell and buried itself in the ground, forming an obstacle to the progress of the train. The driver of the engine behind the train not being aware of what had occurred, and attributing the additional resistance to the inclined plane, left his steam on and drove the wagons one over the other with tremendous force.—About a dozen trucks were more or less damaged, one being driven completely into a field near the line, and several quite smashed

up. Between thirty and forty sheep and two calves were also killed. The state of the line, covered with broken wagons and dead and dying animals, may be better conceived than described. We are happy to say that the guards and engine drivers escaped unhurt. No passengers are taken by the goods trains on the Great Western railway.—*Bath Journal*.

**The Dee Bridge Accident.**—Herapath says that the evidence in this melancholy accident has been closed with a verdict by the jury, that the bridge gave way not from any lateral blow, but from insufficient strength of the cast iron girders. The jury at the same time travel out of their way to condemn 100 railway bridges of the same kind built and building in various parts of the country.

Whether the bridge was of sufficient strength, or whether it was not, we have not gone into the computation, so as to be able to answer. Mr. R. Stephenson, Mr. Locke and Mr. Vignoles, who are all experienced men, and have constructed several bridges of the kind, allege it was sufficiently strong. The government engineers, Capt. Simmonds and Mr. James Walker, C. E., report as Mr. Walker usually has, that is, as locomotives are able to go, forward or backward, or rather like the oracles of old, so as to be interpreted either or any way—a method, in our opinion, far from creditable and demonstrative of conscientious ignorance, or of a lack of moral courage to speak their sentiments. Mr. Robertson, C. E., on the other hand, boldly declares the bridge to have been too weak theoretically and practically, and endeavors to support his opinion by calculation.

As before observed, we can give no opinion on this subject, from not having gone into the inquiry. Generally we are against cast iron and suspension bridges, particularly when the former are constructed of straight cast iron girders; but, still it is possible to make them strong enough, and Stevenson has not hitherto shown himself too niggardly of expense, when strength is the object. If he has erred that way now, we believe it is the exception, not the rule.

We would not be understood to defend or condemn him in this instance, simply because we have not data before us to do either with conscientious safety. The jury have no doubt done what they thought to be right; and we have therefore no reason to blame them, as far as the Dee bridge is concerned. We cannot, however, help thinking that they have been somewhat rash, unacquainted, as they were admitted to be by the coroner, of engineering matters, to give so positive an opinion of the cause of the accident, and of the insufficiency of the strength of the bridge.—Men of sound science and experience never exhibit that dogmatic confidence.

We are also surprized at the fling which they give to these structures generally. What may be their own opinions of themselves, it is not difficult to guess, but we much doubt if their temerity and dogmatism will realize anything with men whose opinions are worth having beyond a smile at their complacent self-sufficiency.

**Metallic Hub, Spoke, and Rim.**—A Mr. Holmes of Moscow, N. Y., has at length perfected a metallic hub, spoke and rim, carriage or wagon wheel, by bracing the spokes in two rows on the hub, which is in two parts, a cylinder in which the spoke is screwed or riveted, and the axle sheathed. The spoke is also riveted or screwed into the rim.

**Another Smoke Consumer.**—A patent has been taken out by Messrs. W. G. and W. Taylor, London, to be applied to all furnaces constructed in the ordinary manner, with open ash-pits, for affecting a more perfect combustion of the inflammable gases and unconsumed carbon. It consists, first, in the application of an exhausting and blowing apparatus; and secondly in a peculiar distribution or arrangement of the smoke flues, so as to be adapted to the operations of such apparatus. A fan or blower is applied to the flue just before the entrance to the chimney, to arrest the smoke and unconsumed gases, and force them through a flue, leading therefrom, an opening on, to the dead plate at or near the front of the fire bars. By this means the whole is passed over the incandescent fuel where it is consumed instead of passing up the chimney unconsumed.

**ATLANTIC AND ST. LAWRENCE RAILROAD.**—Notice to Contractors.—Proposals in writing will be received at the office of the Atlantic and St. Lawrence Railroad Company, in the city of Portland, until Tuesday, the tenth day of August next, inclusive, at sunset, for the grading, masonry, and bridging of that portion of their road extending from the termination of the second division near the hotel road in Danville, to a place in the vicinity of Norway and Paris cove, a distance of about 20 miles.

Maps, profiles, and specifications will be ready for examination on and after the second day of August next, at the Engineer's office in Portland, where all necessary information will be given.

The company will require, as one of the stipulations of the contract, that the heavier work on any section, shall be first attended to, so that the heavier and lighter work may be completed at nearly the same time.

Persons unknown to the officers of the company must accompany their bids with satisfactory evidence of their ability to execute the work. In all cases good and sufficient bonds with two or more sureties will be required for the faithful performance and fulfilment of the contract.

WM. P. PREBLE, President.

Portland, June 30, 1847.

309

**MICHIGAN CENTRAL RAILROAD.**—NOTICE TO CONTRACTORS.—Proposals will be received by the Subscriber until the 1st of August next, for the Grading of that portion of the Michigan Central Railroad lying between Antwerp and New Buffalo, a distance of 60 miles.

Profiles and specifications will be ready for examination after the 15th day of July next, at the office of the subscriber, or that of Col. J. M. Berrien, at Kalamazoo, at which time the line will be shown to contractors.

J. W. BROOKS, Supt.

Michigan Central Railroad Office,  
6126 Detroit, June 17, 1847.

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fittings.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

\* \* Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

## FRENCH AND BAIRD'S PATENT SPARK ARRESTER

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Supt Hartford and New Haven Railroad; W. R. M'Kee, Supt Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Supt New Jersey Railroad Trans. Co.; J. Elliott, Supt Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Supt Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Supt Macon Railroad, Macon, Ga.; J. H. Cleveland, Supt Southern Railroad, Monroe, Mich.; M. F. Chittenden, Supt M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinkley & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

\* \* The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston.

ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR, 445 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$19 =	\$696 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33f

### LAP-WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

### RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

ENGINEERS' AND SURVEYORS'

**INSTRUMENTS MADE BY  
EDMUND DRAPER,**

Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.  
West Troy, May 12, 1847.

**THE SUBSCRIBER** has on hand a good assortment of his best Levelling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

ANDREW MENEELY.  
1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

19f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents,  
1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by

JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 331y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad. To all whom it may concern:—This is to certify that the New Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup<sup>r</sup> Motive Power

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4 $\frac{1}{2}$	13 5	10	24 -		50	15-16	20
13	3 $\frac{1}{2}$	9 3	8 $\frac{1}{2}$	16 -		27	11-16	13 $\frac{1}{2}$
14	3 $\frac{1}{4}$	6 11	7 $\frac{1}{2}$	12 8		17	9-16	10 $\frac{1}{2}$
15	2 $\frac{1}{2}$	5 2	6 $\frac{1}{2}$	9 4		13 $\frac{1}{2}$	1-2	7 $\frac{1}{2}$
16	2 $\frac{1}{4}$	4 3	6	8 8		10 $\frac{1}{2}$	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 30 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

1y35

Philadelphia, Pa.

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard

now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2. [1lf] 68 Broad St., New York.

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

ja45

Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

a45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents.

No. 139 Greenwich, corner of Cedar street.

June 1, 1847. 10lf

**RAILWAY IRON.—DAVIS, BROOKS** & Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

46lf

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

MANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia. 28th

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. j245

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

### WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 9 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by **MORRIS, TASKER & MORRIS.** Warehouse: S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**TO LOCOMOTIVE AND MARINE ENGINE Boiler Builders.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11th

### PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

**PETER COOPER** 17 Burling Slip.  
1y10 New York.

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron only*. Address

**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
4tf Philadelphia, Pa.

**REEVES, BUCK & CO.,** Philadelphia.  
**ROBERT NICHOLS, Agent,**  
26tf No. 79 Water St., New York.

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

**JOAN F. WINSLOW, Agent,**  
1y Albany Iron and Nail Works,

**LAP-WELDED WROUGHT IRON TUBES** for Tubular Boilers, from 1½ to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

**IRVING VAN WART,**  
12 Platt street, New York.

**JOB CUTLER, Patentee.**

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 28tf

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**CONCORD RAILROAD.—PASSENGER** Trains in connection with the Lowell & Nashua Railroads, run daily between Concord and Boston, Sundays excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

26tf **N. G. UPHAM, Supt.**

**NEW YORK AND ERIE RAILROAD LINE** SUMMER ARRANGEMENT. For passengers, twice each way daily, (except Sunday,) leave New

York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For Milk—Leave Otisville at 5½ o'clock, morning and evening.

For Freight—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½ A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For farther particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

21tf **H. C. SEYMOUR, Supt.**

**WESTERN RAILROAD.—ON AND AFTER** Monday, April 5, 1847, the passenger trains will leave daily. Sundays excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON,  
Ch. Eng. and Gen. Agent.  
Augusta, Sept. 2d, 1846.

**GREAT SOUTHERN MAIL LINE!** VIA Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4½ P.M., Philadelphia at 10 P.M., and Baltimore at 6½ A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston..... \$21 00  
" " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to STOKTON & FALLS, Agents.

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warren, Huntsville, Decatur and Tusculum, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.  
Atlanta, Georgia, April 16th, 1846.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## NOTICE TO CONTRACTORS.—ANDROS-COGGIN AND KENNEBEC RAILROAD.

Proposals will be received at the Railroad Office, in Lewiston, until the 17th of August next, inclusive, for the Grading and Masonry of the 2d Division of this Road, extending from Green to Belgrade, near Snow's Pond, about 20 miles.

Profiles will be ready for examination on and after the 10th of August, and all necessary information will be given, either at this office, or upon application to the resident engineers on the line of the road.

Satisfactory bonds with sureties shall be given by the bidders, if required.

On the 16th of August, the Engineer will be prepared to accompany Contractors over the line of the road, commencing at the eastern end of the Division in Belgrade.

ROBERT GRACIE.

## Lehigh Coal and Navigation Company.

We give, in this number of the Journal, the last annual report of this company—with the exception of the tabular statements—a part or the whole of which will be given next week. This important work was one of the—if not the—pioneer works of Pennsylvania. It has been extended from time to time, and its usefulness increased very far beyond what its projectors anticipated when it was commenced; and it has probably contributed much more to the economy and comfort of those who use fuel, by its influence on the price of this necessary of life, than to the profit of those who invested their capital in its construction. We trust, however, that the rapidly increasing demand for the coal and iron of Pennsylvania will soon ensure to them liberal returns in the shape of dividends—as no class of capitalists are, in our opinion, entitled to better returns for their investments than those who construct works which so largely contribute to the comfort and prosperity of the masses of the people.

## Western Railroad.

The greatest weeks' work ever done on any American railroad, says the Bunker Hill Aurora of 24th inst., was probably done last week on the Western railroad. The gross amount of receipts, we learn, were \$28,725, being an increase of nearly ten thousand dollars over the receipts of the corresponding week last year. The prosperity of this great enterprise is still onward. The company, we are told, have never yet seen the time when they had road furniture sufficient for their business,—this the directors propose to turnish by means of the new stock, partly payable to-day.

The editor should, of course, have excepted the Philadelphia, Reading, and Pottsville railroad, which earned over thirty-six thousand five hundred dollars every week of the year 1846.

## Cumberland Valley Railroad.

The Carlisle Herald says that "the Cumberland Valley railroad company has made arrangements to lay a new track on the road between Carlisle and Harrisburg, and will commence the work without delay. The new rail will be a heavy bar of nearly double the thickness and weight of the old bar, and make a road far superior to the old for travelling purposes."

Why not lay the right sort of rail now? The time has arrived when none but rails of the most approved form and weight should be used. The

flat bar—even of double the ordinary thickness will be discarded on railroads of any considerable travel and business.

## Sullivan, N. H. Railroad.

At the annual meeting of the stockholders, held at Charlestown, N. H., on the 20th inst., the following Board of Directors was chosen:—Henry Hubbard, Ashbel Hamlin, Charlestown, N. H.; Isaac Parker, Franklin Evans, Boston; Daniel White, Charlestown, Mass.; John W. Tappan, William H. Farwell, Claremont, N. H.

At a meeting of the directors, the Hon. Henry Hubbard was chosen President; George Olcutt, Treasurer, and P. C. Freeman, clerk.

## Profitable Stock.

It is said "that the Commonwealth owns at this time 10,441 shares in the stock of the Western railroad company, which entitles it to 1,323 shares of the new stock, worth \$11 20 per share, advance. This will be a handsome speculation on the part of the State."

Yet how many wise men predicted in the early days of this noble work, that its stock would never pay a dividend!

## The Iron Mines of the Trenton Iron Co.

Mr. Peter Cooper has, we understand, purchased the Andover iron mines, the iron of which is of the best quality for railroads, and 60 acres of land for \$6000. We also understand that this company has it in contemplation to erect furnaces upon this property, and manufacture the pig iron for their extensive rolling mill at Trenton.

## Increase of French Railway Traffic.

It appears that the total traffic receipts from the 1st of January to the 22d June, 1847, on the Paris and Orleans, amount to 4,575,456l.; corresponding period of 1846, 3,905,574l.; increase, 17.1 per cent. The traffic receipts on the Paris and Rouen from 1st January to 19th June, 1847, amount to 4,254,882l.; corresponding period of 1846, 3,532,193l.; increase, 20.4 per cent. This great increase is the more remarkable as these lines have been opened for a period of four years. The amount of traffic since 1844 on these railways has increased above 60 per cent. The returns on the Northern line are about the same rate per mile as compared with those on the above lines at a corresponding period after their opening. These facts should have their full weight with the French government, and convince them of

the advantages to be derived from dealing in a liberal manner with such companies as the Paris and Lyons, Lyons and Avignon, and other lines of great importance to the prosperity of France.

It is difficult to tell where the increase of railway receipts is to cease—in densely populated countries.

#### Mexican Gulf Railroad Company.

The following correspondence is copied from the New Orleans Courier. It is quite an important announcement, and we hope it may prove correct.

"We are happy to acquaint our readers, says the Courier, that Mr. G. Musson, now in Europe, has succeeded in disposing of stock in the Mexican Gulf railroad company, to an amount sufficient to defray the expenses of carrying the road to its termination on the shores of the gulf, directly opposite Cat Island. The following letters show that the British steam packets will stop at Cat Island once a month."

ADMIRALTY, June 17, 1847.

I am commanded by my lords commissioners of the Admiralty to acquaint you that their lordships have ordered such a change of routes for the mail packets as will insure a monthly communication direct between England and New Orleans. I am, sir, your very obedient servant,

J. W. B. HAMILTON.

To G. MUSSON, 70 Picadilly.

70 PICADILLY, June 17, 1847.

SIR:—I have received the letter you did me the honor to address me by order of the lords commissioners of the Admiralty, informing me that their lordships had ordered such a change of routes for the mail packets as will insure a monthly communication direct between England and New Orleans.

Will you please to tender to their lordships my sincere thanks for the favor thus conferred on the merchants and traders of New Orleans, and on the Mexican Gulf railway company?

I am, sir, respectfully, your obedient servant,

G. MUSSON.

J. W. B. HAMILTON, Esq., Admiralty.

#### New York Water Works.

The New York express of Tuesday gives the following synopsis of the water commissioners report:

The semi-annual report of the water commissioners has been published by order of the Board of Aldermen. Amount of funds received from the 1st of January to 1st of July, 1847, was \$35,809 85; the amounts paid out for the high bridge, \$19,350; protection walls, \$3,056 77; salaries to engineers, keepers, etc., \$5,327 08; miscellaneous repairs, \$1,688 25; sundries, \$101 99; damage to private property, \$3,199; taxes on aqueduct lands, \$137 59; legal business, \$331; damage to property in the city, \$650;—total, \$33,041 68.

Total sum expended on the work through the agency of the commissioners, since January, 1835, is \$8,698,329 59. The commissioners have urged the contractors to forward the completion of the high bridge as soon as possible. Of the fifteen arches which carry the bridge, eleven of them are complete, and the remaining four in fair progress. Three of the unfinished arches make a span of 80 feet, and the other a span of 50 feet. The total length of the bridge will be 1475 feet, and the parapet walls already up, measure 900 feet. The contractors have promised to complete the work before the close of the present year. The cast iron water pipes for this bridge are to be furnished by Governor Kemble, of the West Point foundry, at \$52 per ton. Chollar, Sarger, & Dunham, of West Troy, were Mr. Kemble's competitors, but they charged \$54 75 per ton for their pipes. The claim of James A.

Munroe, Esq., for damage sustained by himself and family, by the aqueduct's passing near his residence, has been reduced by mutual consent from \$900 to \$650, and been settled.

#### Charges on the Schuylkill Canal and Reading Railroad.

The Pottsville Journal of Saturday last compares the rates of charge per ton on coal on the Schuylkill canal and Reading railroad as follows:

##### RAILROAD.

The charges by railroad on coal to Richmond, for New York and all places reached by canal boats, are per ton,

To Manayunk, cash, 95	Phoenixville, .....	95
" Plymouth " 95	Reading .....	80
" Norristown " 95	Mohrsville .....	60
" Valley Forge " 95	Hamburg .....	40

##### BY CANAL.

To Schuylkill front, toll 54½, freight 75.....	\$1 29½
Manayunk toll, including back toll, 58, ft. 75, 1 33	
Plymouth, toll 54, freight 75.....	1 29
Norristown, toll 53, freight 70.....	1 23
Port Kennedy, do do .....	1 23
Valley Forge, do do .....	1 23
Phoenixville, toll 51, freight 60.....	1 11
Reading, toll 46, freight 50.....	96
Mohrsville, toll 46, freight 40.....	85
Hamburg, toll 32½, freight 35.....	67½

##### DIFFERENCE IN FAVOR OF RAILROAD.

To Richmond per ton, 23	Valley Forge.....	28½
Manayunk .....	Phoenixville.....	16
Plymouth railroad.....	Reading.....	17
Norristown.....	Mohrsville.....	26
Port Kennedy.....	Hamburg.....	37½

\*The railroad company allows a drawback of 20 per cent. from the rates upon all coal carried to New York, Wilmington, etc., where Schuylkill canal boats can run with safety. They also allow 12½ cents per ton for dumpages on all coal that has to be unloaded on their wharves at Richmond.

#### Gun Cotton.—Recent Experiments.

The gun cotton of C. & F. Lennig was tested yesterday, says the Ledger, at Harding's upper ferry, Schuylkill, with rifles, shot guns, and by using it for blasting rocks. About sixty discharges were made with Cardeza's patent rifle, made for firing with gun cotton, Krider's, and guns of other makers. The principal distance was at the distance of ninety-six yards, and the amount of cotton used in shooting, from three to seven grains. The gentlemen firing were good marksmen, and the result satisfactory. The blasting was done in hard Gneiss rock—the drill hole three feet nine inches deep, two inches in width, and the amount of cotton used five ounces. The explosion cracked off a mass of about ten feet in width, twelve feet in length, and ten feet in depth.

The experiments were conducted under the supervision of Professor Walter R. Johnson and Mr. Smith, committee of the Franklin Institute, and W. J. L. Kinderlin, Esq., editor of the Stadt Post. The result of the experiments and the conclusion of the committee and spectators were these: that gun cotton is superior to gunpowder for sporting purposes in its superior cleanliness, forty discharges not fouling a gun as much as one firing when loaded with gunpowder; in its entire freedom from smoke, which often prevents a second shot with a double barrelled gun, and by the absence of recoil which frequently disturbs the aim for a second shot; in the quantity necessary for a load, being from four to eleven times stronger than gunpowder; and in its cheapness, being but one half the price of powder. The only drawback to its entire usefulness is, that it explodes so quickly that in some instances portions of it are driven from the gun unignited, and part of the explosive force is lost. Inquiry is now

turned to this matter, and we may suppose this defect will soon be remedied, and its entire explosive force brought into play. As an evidence of its swift ignition, we may mention that portions of it were several times placed loose upon gunpowder and fired, the combustion was so rapid, that although the entire mass of cotton exploded, the powder did not catch. For mining purposes it was universally conceded to be superior to powder—in its force and projectile force, and in the absence of smoke, which in mining with gunpowder sometimes prevents the resumption of labor for half an hour after the blast—with cotton not a minute is necessary. It may be conveniently used also for sloping and overhead blasts in holes which it would be impossible to introduce powder.

These experiments are certainly very satisfactory, and establish the reputation of the article prepared by the Messrs. Lennig; and also the fact that it is much more powerful than powder. It must also be admitted that it is a much more dangerous article to handle than powder, and therefore requires a proportionately greater degree of care in its use.

#### Baltimore and Ohio Railroad.

At a meeting of the directors of the Baltimore and Ohio Railroad Company, held at their office in Baltimore, on Friday, 16th of July, the following report was made to the committee on the extension of the road to the Ohio river, and adopted by a vote of 17 yeas to 5 nays:

The committee appointed by the president, under the authority of the Board, at their stated meeting on the 4th of April last, to confer with the authorities of the city of Wheeling, respecting modifications of the recent law of Virginia, relative to the right of way through the State, passed the 6th day of March, 1847.

##### REPORT.

That they promptly and diligently engaged in the duty confided to them. They proceeded to Wheeling, in company with the president, on the 29th of April, and while there had several conferences with a committee on the part of that city, and were also met at that place by several eminent gentlemen from Columbus, Zanesville, Steubenville, and St. Clairsville, in the State of Ohio, representing important sections of that State, having a deep interest and taking a lively concern in the extension of the Baltimore and Ohio railroad to the Ohio river, and who were deputed to make known the views and wishes of the people of the State represented by them as to the terminus on the Ohio river that would most certainly ensure the western connections with Zanesville, Columbus, and Cincinnati, and attract to the road the trade and travel from these points and the country connected with them.

During their conferences at Wheeling, it was discovered that, previously to concluding any arrangement upon the subject of their mission, it would be necessary to direct particular examinations of the several routes authorized by the present law to be made by the chief engineer of the company; and returning to Baltimore on the 7th of May, they despatched Mr. Latrobe upon that duty at as early a day as his engagements would permit him to be absent from the office. He proceeded to make the necessary examinations, and returned to this city on or about

the 26th of June, and immediately afterwards the committee on the part of Wheeling came to Baltimore and resumed the negotiations in which we had been previously engaged.

The examination of Mr. Latrobe, as far as it could be done without instrumental surveys, demonstrated to the satisfaction of the committee, that the cheapest route to *Wheeling*, through the State of Virginia, was that which proceeded by the ravine of *Fish* creek to the mouth of that stream on the Ohio, and thence by the banks of the Ohio to the city of *Wheeling*. According to his examinations, the route by the mouth of *Fish* creek proved to be less expensive to construct, maintain and work, than the route prescribed by the acts of 1844, 5, and 6, and rejected by the stockholders, by \$514,195, and cheaper than the route by *Grave* creek, referred to in the present law, by \$276,213—thus placing it at the option of *Wheeling*, by waiving her right to pay the difference in the expense of the second and last routes to permit the road to be constructed to that city by the mouth of *Fish* creek, only sixteen miles higher up the river than the mouth of *Fishing* creek, and twenty-eight miles below the city of *Wheeling*.

Your committee deemed it their duty, and as important to the interests of the stockholders, to insist upon the option of adopting that route, and of touching the Ohio river at the mouth of *Fish* creek, if they desired to do so, and they finally concluded an arrangement with the committee of the city of *Wheeling*, by which that right or option has been secured, and by which the city of *Wheeling*, moreover, agrees to subscribe to the stock of the company the sum of \$500,000 in money, or in bonds guaranteed by the State of Virginia, and also to provide the company, free of expense, a depot in the city, with the right of way through the city limits, and the use of the locomotive engines through the streets.

The arrangement thus concluded, is now submitted with this report; it has been already duly ratified by the authorities of *Wheeling*, and if the law be accepted by the stockholders of this company, will be binding upon that city. The committee are of opinion that by this arrangement and according to the present law, the company may secure all the substantial advantages they ever expected from a terminus of their road at a southern point on the Ohio, and at a cost not greater than those advantages would fully warrant.

The committee deem it proper to add, that unless the obligation it imposes of constructing the road to *Wheeling* could be deemed objectionable, which in the present posture of their affairs, and for the considerations they will hereafter advert to, they cannot admit, the present law of Virginia grants the right of way upon as favorable terms as any they have heretofore obtained, or could expect hereafter to obtain.

It does not require the company to adopt the route or any objectionable part of it, heretofore prescribed by the act of 1844-5 and 1845-6, and rejected by the stockholders, but gives them the option of at least three other

and different routes, considerably cheaper, and of seeking a terminus of their road at the mouth of *Fish* creek, only 16 miles higher up than the point heretofore preferred as the southern terminus on the Ohio. It releases them from all restrictions upon their tolls, in competition with the canal or other rival works, and in requiring the establishment of a depot at the canal basin on the *Shenandoah* and at *Cumberland*, it does little more than repeat the obligation to which the company is already subjected by the laws of Maryland, and which, on the *Shenandoah*, it has actually complied with. It does not impose upon the company any obligation to complete all parts of its road simultaneously; on the contrary, it imposes that obligation only in respect to the portion of the road west of the *Monongahela* river, and allows the privilege of resting at that river, or at any point east of it, during the term prescribed by the act. The committee are free to express it as their opinion, however, that if the company accept the law, they should not contemplate the necessity of using this privilege, but should, on the contrary, desire to press the work forward with all possible despatch, to its terminus or termini on the Ohio river. The committee, moreover, deem it important to add that, while the law in one of its sections guards against an implied renewal of the contract by the State of Virginia, to part of the construction of the road from *Harper's* ferry to *Cumberland*, it leaves the contribution of 25ths of the cost of the extended road within the State, to the operation of the general laws and other policy of Virginia.

The committee have some reason to believe that this was not unintentional, and are not without much reliance upon the assurances and cordial co-operation of the interests of *Wheeling*, to procure from the State the usual proportion of 25ths of the cost of the extended road from the Maryland State line to that city. The committee conclude this part of their observations by stating that the agreement now concluded, obtains for the company all the advantages and concessions which the Board, as explained in the address of the president to the stockholders at their meeting on the 5th of April last, contemplated to insist upon.

If, then, the substantial advantages ever contemplated from a connection of the road at a southern point on the Ohio, may be expected from the termini at the mouth of *Fish* creek and at *Wheeling*, the company could not have demanded greater privileges in its extension and future working than this law confers.

That these advantages may be realized from the termini secured by the law, and the arrangement with *Wheeling*, the committee are equally well persuaded.

In prosecuting the road to the Ohio river, the committee have never doubted, that it was not more the primary intention and object of the company, than essential to the interests of the stockholders, and the trade and prosperity of this city, that it should terminate at such point south on the river as would most certainly secure the trade and

travel passing up the river, and, by early and favorable connections with the western improvements, avoid the hazard of rivalry and competition with our northern cities, attract the trade and travel of the great west upon their road, and bring them to Baltimore.

In the pursuit of these objects, it would be far more advisable to complete their work even at a much greater cost, to a point at which they would reach the trade and travel free from all competition, than to expend a comparatively less sum upon a work which would annually expose them to the loss of the principal advantages of the enterprise, and oblige them to maintain a competition, upon unequal terms, with formidable rivals.

The uniform history of the company shows that its aim has been to go far enough south on the Ohio to arrest the trade and travel passing up the river, to connect certainly and advantageously with the progressive improvements in the west, and to escape from the competitions with *New York* and *Philadelphia*. It would, therefore, be a departure from the uniform purpose of the company, and from the settled public opinion in this community for twenty years, if, neglecting this obvious policy and forecast, we could be content to expend millions of our capital, to attract the travel and trade from southern points at which they could be obtained without competition, and draw them to another point farther north, at which we would be compelled to engage in a close and powerful rivalry for a small share of either.

That point which would afford the greatest security for the river trade, and promises the earliest and surest connections with the western improvements, is the one to which the company should direct its attention and resources.

If not from the origin of the enterprise, as early, certainly, as 1835, the city of *Wheeling* had been preferred, and accordingly selected, by common consent, as the most suitable point to obtain those objects; and it is worthy of observation, that this preference was adopted and avowed when the principal dependence both for trade and travel was upon the river navigation and the National road, with little expectation of such an extension of railroad as has been since projected through the State of Ohio.

On these grounds *Wheeling* had been conclusively adopted by the terminus of the main stem of the road, even subject to the embarrassment and additional expense of making a branch to *Pittsburg*, as a bonus to the State of Pennsylvania for the privilege of passing through the territory of that State to the preferred southern point.

The application of the company to the Legislature of this State and to the City Council, for an increase of their subscription to the amount of \$3,000,000 each, represented *Wheeling* as the terminus of the main stem, and *Pittsburg* as a branch only, which could not be avoided: and the contributions, both on the part of the State and city, were made in the expectation that the road would be prosecuted, if practicable, in pursuance of that design. The same purpose was mo-

emphatically declared by the company, and affirmed by the Virginia Legislature in 1838, limiting in express terms the terminus of the main stem at Wheeling, and until the year 1843, the company never wavered or faltered in its purpose, or had reason to doubt the feasibility of its object. In that year, the law of Pennsylvania granting the use of its territory, expired, and that State refusing to renew the grant upon terms which the company could accept, and under an impression that there was no approach to the river at Wheeling without passing through Pennsylvania, the company was obliged to turn their attention to a point even farther south, and accordingly applied to the Legislature of Virginia for permission to select a terminus at any point not below the mouth of the Little Kanawha.

The first application for this purpose failed, chiefly for the want of time during a short session of the Legislature; and before the commencement of the following session, the engineer of *Wheeling* discovered a route to that city by which it was insisted that the road could be constructed without passing through the State of Pennsylvania; and that route, by a law of two successive sessions of the Virginia Legislature, was prescribed as the only condition upon which the right of way through that state would be renewed.

Each of these laws was rejected by the stockholders, and it being well understood that the objections to the route they prescribed were insuperable, the recent act of that State relaxed the conditions of the previous laws, and allowed the company an enlarged option in the selection of their route. In all the recent efforts of the company, therefore, to obtain the right of terminating their road lower down the Ohio, the motive did not so much proceed from an objection to the suitability and advantages of Wheeling as a terminus, as the route by which they were required to construct the road to that city.

It is not to be denied that when compelled, as already stated, to turn their attention to another terminus than Wheeling, the western improvements by railroad, which had been projected in the interim formed a necessary element in the calculations of the company; and they were, moreover, led to believe by the reconnoissances and reports of their engineer, that a more southern point offered even greater advantages as a terminus of the road, than the point previously preferred, and it must be stated that, so far as can be inferred from those reconnoissances and reports, the mouth of Fishing Creek or Parkersburg, was deemed by the engineer as the point better than any other adapted to the objects of the company. It may be admitted that this preference was in some respects well founded, though the committee do not hesitate to express it as their opinion, that subsequent information and a more thorough investigation of the subject, have shown that it was not entitled to the force that had been generally conceded to it.

The preference of the mouth of Fishing creek, as a terminus of the main stem, was justified by the saving of distance, in refer-

ence to the western trade, compared with any other point on the river from the mouth of the Little Kanawha to Pittsburg inclusive, except the mouth of *Fish* creek; by the cheapness of construction over each of the other routes with the same exception, and by the greater facilities which, it was alleged, it afforded in forming connections with the projected improvements, on both lines, on the west side of the Ohio river. It is to be here observed that, both in cost and in distance, east of the Ohio, the road to the mouth of *Fish* creek would be the same as to the mouth of *Fishing* creek. It was particularly urged that from the mouth of *Fishing* creek connections with the Ohio works upon the central line through *Zanesville*, *Columbus*, and *Xenia*, to Cincinnati, could be formed with greater advantage than from any other point; and that with the southern line of improvements through *Marietta*, *Athens*, and *Chillicothe*, to Cincinnati, it was the only point, excepting Parkersburg, from which a connection could probably be made.

Without these advantages, *Fishing* creek would be entitled to no preference over any other point from which they might be obtained. Upon the ground of its superiority in these respects, real or supposed, the preference for *Fishing* creek has rested, and upon the same ground the stockholders, at their meeting on the 22d day of February last, declared their willingness and determination to accept a law which should oblige them to construct their road to *Wheeling*, if they could be allowed the privilege of constructing it to that city by the way of *Fishing* creek.

The committee, therefore, think, that if, from better investigation and more recent information, it appears that the same and even greater advantages which were expected from touching the river at the mouth of *Fishing* creek can be realized from the construction of the road, at no greater cost, to *Wheeling*, by the mouth of *Fish* creek, sixteen miles higher up, the present law is equally entitled to their acceptance.

It may be conceded, that the distance by the mouth of *Fishing* creek, with reference to the trade with Cincinnati would be less than by other points on the river, excepting Parkersburg north or south; and that the cost of constructing the road to that point would be less than to any other southern point excepting to the mouth of *Fish* creek; but the committee apprehended that neither distance nor cost, unless they are sufficiently great to obstruct the business of the road, or defeat the ability of the company to make the work, are points most deserving of consideration. If the cost be within the ability of the company, and the terminus such as to command the full amount of trade and travel, the elongation of the distance, so far from forming an objection, becomes a positive advantage, by increasing the profit upon a lengthened line of road.

Nor must it be forgotten that the object of extending the railroad to the Ohio river is not for the mere trade and travel of the point to which it may be extended; that is altogether a subordinate consideration.

The object of reaching the Ohio is to get within the proximity of the trade and travel of the great west beyond that river, and the point from which these can be most certainly secured is that to which the road should be carried.

The question, therefore, the committee repeat, is from what point the trade and travel of the river can be most certainly commanded, and with which the improvement west of the river could most advantageously connect.

It is to this consideration, and to the information they have acquired in relation to it that the committee would particularly invite the attention of the Board. Their investigation has developed facts and information which had not previously received sufficient attention, and has led the committee to the conclusion not only that the cost of the construction of the road to Wheeling will be little, if any, more than to the mouth of *Fishing* creek (and considerably less than to Parkersburg) the uniformly preferred routes, but that the advantages of connection with both lines of works in Ohio will be even greater and more certain of accomplishment, from the route authorized by the agreement with the city of Wheeling, than from a terminus at the mouth of *Fishing* creek.

There are two great lines on which the public works through the State of Ohio, intended to connect with St. Louis to the west, and north with the Lake country, and projected to the Ohio river.

One is called the Southern line, extending through *Chillicothe*, *Athens*, and *Marietta*, and the other is denominated the "Great Central line" leading from Cincinnati through *Xenia* or *Springfield*, *Columbus*, and *Zanesville*; and a terminus at *Fishing* creek was originally preferred as being equally suited to a connection with the works on both of these lines.

It may be conceded, that from that point a connection could be formed both at somewhat less cost and distance with the southern line than from Wheeling, or even the mouth of the *Fish* creek; and it is equally true that from Parkersburg the connection could be formed with even greater advantage than from *Fishing* creek, or any other point on the river. It is also true, however, that a connection with the southern line could be formed at little more expense, and with scarcely less advantage, from the mouth of *Fish* creek than from that of *Fishing* creek.

*Fish* creek being only sixteen miles higher up the river than *Fishing* creek, and the elongation of a road over that distance costing not exceeding \$250,000, it is not to be doubted that the cities and counties interested in the southern line, would be quite ready to incur that expense in extending their works to the upper point. It may therefore be assumed as certain, that in procuring the option of going to the mouth of *Fish* creek, the company has as effectually secured an early connection with the southern line of improvements in Ohio as they would have done from *Fishing* creek, and that in this respect the object of the stockholders, as declared at their meeting on the 22d of February last, will be

fully accomplished. And it is perfectly certain, that with a point north of Wheeling, and even of Fishing creek, a connection with the southern line of improvements, if a northern terminus were adopted, would be lost to the road altogether.

The committee, however, consider it even more important to state, that their recent investigations have shown that with the great central line of the Ohio improvements from Cincinnati through Columbus and Zanesville, already in a more advanced state, and with greater means of completion, a connection could not be advantageously made from the mouth of Fishing creek, and would be more promptly and certainly formed at Wheeling than at any other point north or south of the Ohio river.

The committee cannot doubt that this consideration must give a new and important aspect to the subject, and that it should have a controlling influence over the future decisions of the company.

On this ground, in reference to the central line of the Ohio improvements, the advantages of a terminus at Wheeling would be superior to those of Fishing creek; and, combined with the right of touching at the mouth of Fishing creek, the route authorized by the agreement with Wheeling would not be inferior to any other on the Ohio river.

The committee have already alluded to their conferences, while at Wheeling, with representatives attending from several parts of the State of Ohio, and they have now to add that, during their recent conference in this city, they were attended by Mr. Alfred Kelly as the representative from the city of Columbus.

Mr. Kelly's long and eminent connection with the construction and management of the public works of Ohio, is well known in this community; no man has been longer or more usefully engaged in those important improvements, or is more intimately acquainted with the topography and resources of that great State. He is at present at the head of one of the works upon the Central line, passing through Columbus, and designed to form part of the great west and east line from St. Louis, and was selected by the authorities of Columbus to attend the conferences between this company and Wheeling, and to speak authoritatively of those points on the Ohio river with which it would be consistent with the ability and interests of the Ohio improvements to connect.

A summary of Mr. Kelly's views upon these points is substantially embodied in two letters to the President, dated 2d and 5th of July instant, which the committee submit to the Board with this report, and which will be found remarkably to corroborate the statements both as to comparative routes and distances to the several points on the river, and in reference to the lake trade presented by the President to the stockholders of this company in his address to the stockholders of the 5th of April last.

They have also received the official proceedings of a convention of the several companies chartered to continue the line of rail-

ways from Columbus to the Ohio river, held at Zanesville on the 1st day of the present month, which they beg leave to submit with this report, as not only explanatory of the views and interests of those companies, but as illustrative of the resources of the State of Ohio, and as containing in the preamble and report of the committee, some interesting and valuable information of the utmost importance to the future course of this company. Besides these, the President and the committee have received various unofficial communications from numerous individuals of the first eminence and best practicable information, all concurring in the views expressed in the papers herewith submitted.

From all these sources, the information is uniform that, in conformity with the established policy and interests of the State of Ohio, Wheeling is a preferable point with which to connect the public works than any other north or south on the Ohio—the distance from Columbus to Pittsburg being more than seventy miles, and from Zanesville at least that number of miles greater than to Wheeling and the country through which a line of communication with the former would pass, offering fewer advantages, would seem to render a connection by the Central line, with Pittsburg, a matter of necessity, or dependent upon an amount of trade too great to be accommodated by other works. It would appear, also, that if the distance from Columbus and Zanesville to the mouth of Fishing creek be not greater, the intervening country, besides being unproductive and offering comparatively small means for the making or employment of a railroad, is not favorable to the construction of such a work, and these objections we deemed so strong as to authorize a distinct intimation that the termination of the Baltimore and Ohio railroad as low down as Fishing creek, might create the necessity of more northern lines, which, if a terminus at Wheeling, or near it, were adopted, would not be apprehended.

Mr. Kelly's letter shows that a continuous line of railway from Cincinnati to Columbus, a distance of 130 miles, will be soon completed, leaving only 155 miles to extend it to the Ohio.

The committee would add, that all the assurances and representations they have received, lead them to the conclusion that the counties of Ohio through which the line, in connection with a terminus opposite Wheeling would pass, are among the wealthiest in that State, and that, if this company determine to construct their road to Wheeling, and engage in the work earnestly and in good faith, the Ohio improvements from Columbus to Wheeling, will be completed as soon as this road can be extended to the river.

To be continued.

#### Susquehanna Railroad. Extension from York to Harrisburg.

Continued from page 471.

Some have asserted that nature has raised insurmountable barriers across the route of the Central road. The difficulties have been much exaggerated. From the reports of intelligent engineers, it appears that, by mak-

ing two tunnels of no extraordinary length, the mountains may be passed, and the whole road constructed, so that the maximum grade would never be more than 45 feet to the mile.

We have stated the estimated cost of the work, and the amount of stock already subscribed;—can the balance of the stock be taken? The committee have been assured that it will be; and they see no reason to doubt it. The distance from Cumberland to Pittsburg, by the southern or Savage river route of Baltimore and Ohio railroad (which seems now to be settled upon) is 178 miles, and the estimated cost \$4,383,070. The distance from Harrisburg to Pittsburg by the Central road is 228 miles, and the estimated cost \$7,000,000:—a difference of only 50 miles of distance, and \$2,616,030 of expense in the two undertakings. If we compare the population and wealth of the two States, it would seem that extension from Harrisburg is a much easier undertaking for Pennsylvania, than that from Cumberland is for Maryland. If Baltimore extends her road to Pittsburg, who can doubt for a moment, that Philadelphia will then (if she should delay until then) put forth her utmost energies to effect the completion of her central road? Can it be hoped that she will look on with a calm indifference while a rival city snatches away the rich treasures of the west,—the golden fleece which she herself had already spent so much toil and treasure to secure? It may be said that Philadelphia has already a canal communication with Pittsburg, which has cost an immense outlay, and that she will not be willing to expend millions more in making a railroad to the same point. Let it be remembered that the march of improvement is onward with daily increasing speed. Time is now emphatically regained as money. Merchants of different cities buy and sell by telegraph! The canal boat drawn by the sluggish mule can no longer successfully compete with the lightning speed of the steam driven car! The daily increasing passenger travel from the populous west would alone induce Philadelphia to undertake the construction of the Central road. Should Baltimore extend her road to Pittsburg, the necessity for hastening the completion of the Central road would be increased.

When the Central road is finished, the passenger travel between Baltimore and the west by way of the York and Cumberland railroad would certainly be very great. It would possess an advantage over the Baltimore and Ohio railroad in respect to relative distances, which would be as follows:

Ohio railroad, via Cumberland and the mouth of Savage river (southern route)	356 miles.
From Baltimore to Pittsburg by way of the York and Cumberland railroad, and Central road of Pennsylvania	316 "
From Philadelphia to Pittsburg by Central road	334 "

It will thus be seen that, by the Harrisburg route, Baltimore would be 40 miles nearer to Pittsburg than by the Cumberland and Savage river route. She would also be 18½ miles nearer than Philadelphia. If the northern and Castleman's river route be

adopted by the Baltimore and Ohio railroad company, the difference in distance of the two routes from Baltimore would not be so great; but it would still be in favor of the York and Harrisburg route. These advantages could not fail to attract a large portion of western trade and travel to this road.

The committee do not wish to be understood as opposing a connexion between Baltimore and Pittsburg by means of the Baltimore and Ohio railroad. As Baltimoreans, they earnestly desire to see that great work extended to the banks of the Ohio river, its only profitable terminus. Whether Pittsburg, or a more southern point, should be chosen for the connexion, they leave to be determined by those having the management of the affairs of that corporation. If the connexion be made at Pittsburg, it would not necessarily follow that the interests of that work and of the York and Cumberland road would be conflicting. If we regard the rapid and daily increase of the western states in wealth and population, and estimate from their past progress what will be their future greatness, we will find that, in a few years, the business of that wonderful region will furnish an amount of freight and travel sufficient to give constant and profitable employment to both works. In 1810 the population of the Mississippi valley was 1,064,703. In 1840 it had reached 5,335,578. By the same ratio of increase, in 1870 (within twenty-three years,) it will be 26,000,000! Some idea may be formed of the value of the agricultural products of this region from the estimates furnished in the report of the commissioner of patents for the year 1845, by which it appears that, besides other staples, the corn crop alone for that year amounted to 273,384,000 bushels, and the wheat crop to 55,384,000 bushels. A considerable amount of these products is sent annually to the Atlantic cities for foreign exportation. Increase of facilities produces an increase of trade. If greater facilities of internal communication were offered, and the expenses of transportation thereby lessened, how much greater an amount of western productions would annually pass the Alleghenies: And which of all the cities of the sea board is more advantageously located for the western trade than Baltimore? Nature has done much for her. It only remains for her citizens to appreciate her advantages and to improve them. Human art and enterprise may perfect what nature has done; and the monumental city may secure to herself the larger portion of the trade of a region able at all times, from its surplus products, to supply the starving millions of Europe with food!

The committee, therefore, think that both connexions with the Ohio might very properly be made. The construction of the York and Cumberland road would cost a comparatively small sum. This can be spared from Maryland and Pennsylvania capital, and an abundance of means left for the completion of the Baltimore and Ohio railroad.

In conclusion of this part of their report, the committee would recapitulate the follow-

ing important items from which the profits of this road might be expected to arise:

1. *The Produce Trade of Western and Southern Pennsylvania.*—The amount of this trade would be large, and its nearest market Baltimore.

2. *The Lumber Trade.*—This road would bring Baltimore in direct communication with the pine forests of the Upper Susquehanna, and with Middletown, the greatest lumber market in the southern or middle states.

3. *The Iron and Coal Trade.*—The anthracite and bituminous coal basins of Dauphin county would soon supply this road with a trade which of itself would render it a profitable investment. From the great difference in the cost of fuel upon the two routes, coal could be carried at much less expense upon this than upon the Reading railroad.

4. *The Passenger Travel in Western Pennsylvania.* This road would furnish the shortest and cheapest route to Washington for three-fourths of the counties of Pennsylvania, and to many of the southern counties of New York, containing together a population amounting to two millions. Passengers could leave Harrisburg at 4 o'clock in the morning, reach Baltimore in time for breakfast, and thence proceed to Washington, where they could arrive by 11 o'clock.

5. *The Freight and Passenger Travel of the West.*—When the Central road is finished this must be very great. This road will possess advantages which will enable it to compete successfully for this trade with any other work.

### III.—ADVANTAGES TO RESULT TO BALTIMORE AND MARYLAND FROM ITS CONSTRUCTION.

The Baltimore and Susquehanna railroad extends from Baltimore to the Maryland line, and thence, by means of the York and Maryland line railroad, to the borough of York, a distance of 58 miles. In this work the State of Maryland has invested \$1,884,054 25—besides large arrearages of interest due from the company, and Baltimore city \$850,000. Nearly every ton of freight and every passenger passing over the York and Cumberland railroad, would also pass over this road. The former would be about 29 miles in length. The trade of the York and Cumberland railroad would thus swell the receipts of the Baltimore and Susquehanna road, and would soon render profitable the large investments of our State in that work—and eventually enable the company to make dividends to the city and private stockholders. Another result even more important would be the creation of a new and valuable trade for our city, affording employment for her capital, a field for the enterprise of her merchants, and a strong and lasting impetus to her growth and prosperity.

Nor would the advantages arising from this work result solely to our own State. Pennsylvania is equally interested in its completion. By this means, the citizens of many of her congressional districts will be benefited by having a nearer and cheaper route to the National Capitol and other southern

cities. Thousands of the farmers of her interior counties would find their lands increased in value from the increased convenience for sending their crops to the Atlantic sea board. Coal fields and mineral lands now neglected and valueless, would be opened and give wealth to their possessors. Thus, while no part of the State would be injured, thousands of her citizens would receive important benefits from this proposed connexion with our city—a work which would create business for itself, by producing a new trade and increased travel.

The committee therefore think, that the agricultural interests of Pennsylvania and the commercial interests of Baltimore, would alike be promoted by the construction of the York and Cumberland railroad. They also believe that it would be a profitable investment for capitalists.

The committee have thus endeavored to discharge the duty imposed upon them. It will be for the Board to take such action upon the subject of this report as to its members may seem proper.

COLEMAN YELLOT,  
R. M. MAGRAW,  
WILLIAM P. POWDER, } Committee.

The above report was read at a meeting of the Board of Directors of the Baltimore and Susquehanna railroad company, on the 17th of June, 1847: and, on motion was adopted and ordered to be printed.

**Lehigh Coal and Navigation Company.**  
*Report of the Board of Managers of the Lehigh Coal and Navigation Company, to the Stockholders.—May 4, 1847.*

At an election held May 4, 1847, the following named persons were chosen officers of the Lehigh Coal and Navigation Company, for the ensuing year:

*President*—James Cox.

*Managers*—John Cox, Josiah White, Erskine Hazard, Henry Cope, Caleb Cope, George Abbott, Joseph Fisher, John Farnum, Henry J. Boller, John Brock.

*Treasurer*—Otis Ammidon.

*Secretary*—Edwin Walter.

### REPORT.

In compliance with the requirements of law, and in the performance of a duty, which, from the greatly improved condition of the company's affairs, is discharged with even more than the usual alacrity, the Board of Managers have the pleasure to submit to the Stockholders, the following report "on the situation of the concerns committed to their charge."

Shipments of coal for the year 1846 began on the 1st of April of that year; but, in consequence of the injury to the Delaware Division from high water, deliveries were, until the 24th of that month, restricted to the line of the Lehigh.

From the commencement until the close, on the 10th of December last, of operations on the company's canal, there was no interruption, from any cause whatever to the navigation.

Owing to causes, some of which could neither be foreseen nor provided against, and all of which were, more or less, beyond the

control of the managers, the production of coal from the coal mines fell short, not merely of the anticipations indulged in at the opening of the season, but of the quantity sent to market during the preceding year.

This deficiency was, however, more than compensated by the increase from the Room Run mines.

The shipments for the year were as follows:

	Tons.
From the old mines of the company.....	165,011
" Room Run ".....	109,652
Making a total from the Co.'s mines of....	274,663
From the Beaver Meadow ".....	85,948
" Hazleton ".....	98,541
" Buck Mountain ".....	46,116
" Summit Coal ".....	11,868
" Wyoming Valley via W. Haven. ....	5,866

Forming an aggregate of coal shipped on the Lehigh canal of.....523,002

And exhibiting an increase of 93,510 tons, or about 21½ per cent. on the shipments of the preceding year.

In addition to the above, there were sent to market during the year 1846, from the company's Tamaqua mines, via the Little Schuylkill railroad, 10,150 tons of coal. The whole quantity taken from them since they were opened is 26,839 tons.

These mines are now leased to parties, and upon terms that promise a large annual increase.

The quantity of lumber transported through the season, reached twenty-seven millions of feet, board measure, showing an excess of five millions of feet over the shipments for 1845.

The quantity and descriptions of freight, carried on the canal during the year 1846, and upon which the tolls amounted to \$250,849 41, are exhibited by the following statement:

## LIST OF FREIGHT, 1846.

	ASCENDING. DESCENDING.		TOTAL.	
	Tons cwt.	Tons cwt.	Tons cwt.	Tons cwt.
Charcoal.....		1,031 16		1,031 16
Coal.....	143 0	523,002 5	523,144 14	
Grain.....	744 17	1,664 11	2,409 8	
Flour.....	873 6	6,559 00	7,432 6	
Salt.....	745 1		745 1	
Salt fish, beef & pk.	544 18	67 8	612 6	
Other provisions..	107 4	17 12	124 16	
Beer, porter & cider	18 5		18 5	
Whiskey.....	113 19	572 2	686 1	
Hay and straw...	256 7	1 00	257 7

Merchandise.....	3,885 19	409 8	4,355 7	
	37,861 8	605,534 15	643,396 3	

As has been the case for several years past the coal from the company's mines, except the reserve to meet the demands of holders of the mortgage loan, was disposed of, and payment received as it reached market.

The navigation, both of the upper and of the lower section, is now in a condition as regards repairs, efficiency and security, better than it has been at any former period.

This desirable state of the line has been

effected by unremitting attention to graving the dams, and by making such improvements for the sake of increased strength and stability, as experience dictated, and the means at the disposal of the managers warranted.

A portion of the work done may fairly be considered as a mere carrying out of the original design; the expense of which might, therefore, with propriety, have been carried to the account of construction; but, from a desire not to swell the cost of the work, it has been deemed expedient to charge the whole to profit and loss.

From the statement this day submitted, it is seen that a beginning has been made in the transportation of coal over the Lehigh and Susquehanna railroad; and there is good ground, in preparations made and contracts entered into, for the confident expectation that not merely will there be, during the current season, a large increase in the quantity of coal passing over the road, but that bar iron and lumber, to a considerable amount, will seek a market by this route; while iron ore and merchandize will furnish a return freight.

In fact, the managers are sanguine as to the extent of the business over the road being such, as with the means at their disposal, will justify them in affording for the year 1848, increased facilities for the transportation and shipment of commodities.

The production of coal from the company's mines, including the Old and the Room Run mines, will for the current year, probably not fall short of 350,000 tons; and may, under favorable circumstances, considerably exceed this quantity; while the aggregate shipments of this mineral on the Lehigh will not, it is supposed, be to a less amount than 650,000 tons.

The improvements, begun within the last few years, and forming part of a connected, extended, and as it is believed, of a well devised system for the steady and progressive enlargement of the company's business, are regularly carried forward to completion; but it is not expected that the benefit, to arise from them, will begin to be fully realized prior to the year 1848. Some of the tunnels will, however, contribute materially to the present season's supply of coal.

The Return Track, under all the disadvantages and disappointments usually attendant upon the first essay of a new work, has proved its capabilities; and will doubtless afford, during the present year, facilities which could in no other way have been so well or so cheaply secured.

In the meantime, the outlay for tunnels, slopes, uncoverings, roads, engines, machinery, dwellings, boats and cars, has unavoidably been very large; and, although the company's property has been proportionably improved by the expenditure, yet it has necessarily abstracted from the means applicable to other purposes.

Notwithstanding this heavy outlay during the year 1846, the managers have felt themselves warranted, since the commencement of the present year, in directing the resumption of the payment, *in cash*, of the interest on the mortgage loan; and have also made a begin-

ning of the discharge, *in coal*, of 25 per cent. of the arrears of interest on the common loan.

These measures, so important for the gradual restoration of the credit of the company, although not carried out at a date so early as was desired, were yet adopted at the very earliest period deemed prudent, or even practicable. Preliminary to their adoption, and within the year 1846, there had been extinguished \$161,000 of debt preferred under the deed of trust; much of it bearing the character of a first lien upon the company's property.

Since the date of the last report, three large anthracite furnaces have been added to those at that time upon the line of the company's works, and there is a prospect that the number will soon be still further increased.

Much is expected from the recent change in the organization of the Morris canal company.

Communicating, as this canal does, at one extremity, with the city of New York, and at the other with the Lehigh canal, at Easton; thus bringing Mauch Chunk within 150 miles of the largest market for anthracite on the Atlantic border; and with an undoubted and an abundant supply of water; all that is wanted, in order to command for the canal a very large through trade, is such an improvement of the planes, and of their machinery, as shall enable the coal scows of the Lehigh to pass, without detaching the sections of which those scows are composed.

This improvement, there is reason to hope, may be effected in time to accommodate the business of 1848.

Even in its present imperfect condition, the line of canal afforded, during the year 1846, a market for more than 50,000 tons of coal; a tonnage, however, which would prove to be but a tythe of what would pass over the canal, were the improvements, of which it is unquestionably susceptible, carried out.

There is ground, too, for the confident expectation, that, during the present year, the long delayed connexion between the Delaware division and the navigable feeder of the Delaware and Raritan canal, will be accomplished.

With these augmented facilities for reaching market, the trade of the Lehigh must, in future seasons, experience a very sensible stimulus, and a corresponding enlargement.

If we now pause for a moment, to look back upon the difficulties with which the company has had to contend—if we advert to the imminent perils to which it has been exposed—if we contrast its situation, almost desperate, and by many despaired of, with its present condition of renovated commercial credit, its more than restored navigation, its nearly completed railroad to the teeming valley of the Susquehanna, its vastly improved and enhanced property, and its consequent and constantly growing ability to relieve itself from the mass of indebtedness under which it has so long struggled,—and if we then turn to the contemplation of the augmented market value of all its obligations, and the comparative ease and security of its present position, it will be apparent to all

that the company possesses within itself restorative powers and available resources, to an extent heretofore scarcely suspected, and only now just beginning to be clearly and fully appreciated.

Whatever credit the managers may be considered as fairly entitled to for the altered circumstances of the company, they have, at least, the satisfaction of knowing that they have not been wanting in fidelity to the trust reposed in them; and they enjoy the high gratification derived from the consciousness that, in promoting interests identical with their own, they have contributed something to the relief and to the comforts of the many individuals who have invested their means in the stock and loans of the company.

To the statements of accounts this day submitted to the stockholders, and the most interesting and important of which will, with the approval of this meeting, be appended to the printed copies of the report, reference is made for a condensed exhibit of the results of the past year's business, and for a clear exposition of the financial position of the company at the close of that year.

By order of the Board of managers,  
JAMES COX, President.  
Philadelphia, April 28th, 1847.

From the American Mining Journal and Railroad Gazette.  
**Progress at the Mines on Lake Superior.**

We are again without returns from the several mines on Lake Superior, and again repeat our earnest request to our friends in that quarter, to give us authentic information as to the work and results at their respective mines. The question is constantly put to us, "What news from the mines on Lake Superior?"—and we must confess, as the publishers of a Mining Journal, and with the knowledge, too, that much interesting and valuable information could be easily furnished with a little attention to the subject on the part of those interested, we feel placed in rather an unpleasant position. In the absence of any returns, we have availed ourselves of information kindly furnished us by Captain A. Sherman, a gentleman who has spent a considerable time for the last two or three years in the examination of the mineral region of the country bordering on Lake Superior. Capt. Sherman has visited most of the mines on Point Keeweenaw, since the 1st of May, and at our request has given a minute of the information he obtained from actual observation at the mines he visited, and such information as he received from reliable sources. Some important mines he did not visit, and has given no information respecting them.

**Lac La Belle.**—The work at this mine has been prosecuted with vigor, with a force of from 10 to 15 men. A considerable portion of the labor has been expended in the preparations necessary for the opening of the mine. The quantity of ore raised is, in all, about 400 tons; 50 tons of which are very rich grey sulphuret, estimated to contain from 50 to 70 per cent. of copper. Messrs. Wm. H. Ladd and R. Kernick are erecting smelting works at this mine, which will be in operation by August 15th.

**Bohemian.**—The force employed at this

mine has been much less than at Lac la Belle. The vein is supposed to be a continuation of the Lac la Belle vein. Several tons of ore have been raised of quality similar to Lac la Belle. The prospect at this mine is very flattering.

**Gratiot.**—A very rich vein of grey sulphuret has been recently discovered, of great promise. Thus far, the indications appear better if possible than either the Lac la Belle or Bohemian, both of which are in the immediate vicinity and on the same mineral range. The vein was discovered in May last.

**Eagle Harbor.**—About 15 men have been employed at this mine during the winter. The rock has been excavated along the vein, and from 20 to 30 tons of vein stone of at least 60 per cent. copper, can be taken down without further blasting. A considerable portion of the labor at this mine has been employed in a rigid examination of the several veins upon the mineral location on which this mine is situated. Some of the veins examined are very promising.

**Copper Falls.**—The main shaft is down about 120 feet. An adit is being driven from the level of the water course to intersect the main shaft. This adit is driven along the course of the vein. It is estimated the copper obtained from the vein will more than pay the expense of the adit. The large block of native copper in the shaft has been cut into pieces of from two to three tons each most of which have been raised from the mine. Four shafts have been sunk, and several drifts driven. The amount of vein stone containing copper, and of native copper raised, exceeds 400 tons, estimated to contain an average of 40 per cent. of copper.

**Eagle River.**—But few hands, not exceeding 10, have been employed at this mine during the winter. The labor has been expended mostly in one of the drifts from which a little more than 11 tons of pure native copper had been raised to May 20th. This drift is 120 feet below the bed of Eagle river, and runs from the shaft in which the boulder of pure native silver, weighing 6 lbs. 10 ozs. avoidupois, was found. This drift is along a fissure or rather a series of fissures in the rock, which are filled with gravel similar to that found in the bed of the stream above. In this gravel, boulders and pebbles of native copper are found, shaped like the rock pebbles in many instances, and varying in size from a pea to a pumpkin. Pebbles of pure native silver are also found in this gravel. The 11 tons of copper named above consist of these copper boulders and pebbles, and is perfectly pure copper.

**North Western.**—The force at this mine during the winter was small, and a considerable portion of it was expended in erecting buildings, and other necessary preparations for mining. The main shaft is down to a considerable depth, and a large quantity of vein stone, containing native copper, had been raised to May 30th. The quantity of copper was estimated at over 10 tons. The prospect at this mine is very promising.

**Cliff Mine.**—The main shaft is down 200

feet upon the vein. The lode at the bottom of the shaft is increasing in width. The vein is about four feet wide, and increasing in richness. Drifts have been driven from the main shaft in the direction of the vein. In one of these drifts a sheet of native copper has been found extending 38 feet along the vein, about 10 feet high, and estimated as averaging 14 inches thick. Large masses of native copper, weighing from two to four and five tons, have been found in the other drifts. The lode at the top of the bluff and along the upper part of the vein is from 14 to 16 inches wide, and at the bottom of the main shaft is about three feet wide. The lode through the whole vein contains more or less native copper disseminating through the vein stone. About 100 tons of masses of native copper are now on the way to market. Mr. Sherman saw a large quantity of native copper from this mine on the lake shore ready for shipment, and from 30 to 40 tons on the wharf at the Sault de St. Marie.

**North American.**—This mine has been under the able management of Judge Bacon, and the labor has been expended to as good, if not better advantage, than any other mine on the lake. Several shafts were sunk, and drifts driven during the last year, without the success anticipated. Two rich veins have been recently discovered of great promise. From one of these large masses of native copper superb specimens of native silver have been raised.

**North West.**—Several shafts have been sunk, and drifts driven along the vein. A large quantity of vein stone, containing native copper, has been raised. The vein increases in richness as it descends. The quantity of copper raised during the winter is estimated as more than sufficient to pay the expenses of the mine.

**Algonquin.**—From four to six miners have been at work at this mine during the winter. The main shaft on the vein is down about 30 feet, and a drift along the vein has been driven about 30 feet. About 40 to 45 tons of vein stone, containing copper, estimated at an average of 30 per cent. copper, has been raised, and about one half of it transported to the lake. The lode fills the vein entirely, and is about 30 to 35 inches wide.

**Isle Royal.**—Several discoveries have been made on this island by various companies; some of the mines belonging to the American Exploring company, and the Franklin company, are very promising and valuable. Mr. Whitteley, agent of the Union company; Mr. Talbot, on the northeast end of the island; Mr. Huganón, near Washington Harbor, and the agent of the Ohio and the Isle Royal company, have sent about 50 workmen, with a steam engine and other apparatus, to erect extensive smelting works upon the island, near Rock Harbor. The prospect at the mines upon the island is quite flattering, and appearances indicate that all those discovered are very valuable.

**Amigdaloid Island.**—The mines discovered upon this island by the American Exploring and Mining company, and the Franklin company, are of great promise. At two of

the mines, the companies above named are commencing operations.

**Prince's**—The accounts of large quantities of silver being found at this mine, are confirmed by subsequent reports in some degree, but not to the extent at first reported. A considerable quantity of silver has been found, but to what extent is not officially reported.

**Bruce**.—This mine continues to astonish all who visit it, with the rich display of copper ore. Large shipments of ore have been made, and the miners are busy at work, quarrying out immense quantities of ore. The value of this mine, judging from appearances thus far, is very great; and, taking all things into consideration, is probably the most valuable on Lake Superior.

#### Importance of Mineral Analysis in the Smelting of Iron.

Mr. S. B. Rogers, in a recent number of the London Mining Journal, communicates some very important data relative to the subject at the head of this article. It has been said that "the province of an assayer is exceedingly limited—he merely having to assay a stone for lead, copper, silver, or any other metal,—and there the knowledge of its contents is ended, so far as the assay is concerned." This remark is equally applicable to the examination of the ores of iron by assay. The assayer may approximate pretty nearly to the quantity of iron each ore may contain; but as to their *residua* no information whatever, is generally given,—though in the smelting of iron a knowledge of such residua, both as to nature and quantity, is of the greatest importance.

Mr. Rogers has often urged upon the attention of iron masters the many advantages that would arise from the due analysis of all the materials used in the smelting furnace. The aggregate loss of iron at large works—many thousands of tons annually!—in consequence of no attention being paid to the proper preparation of furnace mixtures, as analysis would clearly point out, would astonish those persons who may be unacquainted with the irregularities of iron furnaces under the present system, or rather non-system, of management; and it is nothing but the immense capital employed at such works that enables the proprietors of them to proceed with their operations over the drawbacks above stated, with comparative success and satisfaction.

The data to which we have referred, and which is given below, is from a work of Mr. Rogers, written some thirty years since, for the purpose of showing that analysis is, alone, in a manner, the sheet anchor of an iron smelter; for without a due and correct knowledge of the elementary constituents of his materials, and of their action and re-action in the furnace, it is impossible for him to anticipate the production of any result whatever, except as a mere matter of chance.

**Data, 2d Letter.**—"It may here be necessary to observe that, for the guidance of blast furnace managers, a correct analysis should, at all iron works, be made of the mines, and also of the limestones or other fluxes employed, and likewise of the coke and its ashes, in

order to show the amount, number, and proportions of the earthly matters therein contained; for, unless an operative manager be made fully acquainted with the earths and oxides upon which he has to work, all his efforts will, at best, be built upon conjecture, and his results entirely the effect of chance."

"The earthly matters of the ore can only be ascertained by analysis; it is, therefore, quite impossible to give data on this head to suit, not only for any two works, but for even a single work, that could be depended upon for a whole twelve-month together; repeated analysis of the iron making materials at each separate iron work should, therefore, be made whenever the slightest alteration appears in their quality."

**3d Letter.**—"A furnace manager, who is generally restricted to the use of limestone for the fusion of his materials, will have to apportion that flux in his charges, to correspond with the amount and nature of the earthly matters of his mines and fuel, and which 'amount' and 'nature' can only be known by analysis."—"The results of hundreds of analysis has convinced me, that no two strata of limestone, enclosing the coal field of Monmouthshire and South Wales, are exactly alike—indeed, stones worked out of the same stratum or bed, seldom continue of the same quality for a year round. Here, again, the smelter can only safely find his way by means of analysis—all else will be mere guess-work, and, therefore, quackery, from following which, countless thousands in value of money and material have been totally lost, both to iron masters and the country at large."

**4th Letter.**—"To remedy this evil—i. e., the use of an inadequate flux for bringing the earthly residua of the materials used in blast furnaces into perfect fusion without the addition of protoxide of iron—there is no other possibly safe and certain road for him to pursue than to repeatedly refer to the components of the materials upon which he (the furnace manager) may have to operate, and that by analysis only; all other modes of proceeding will be merely guess-work, and, therefore, alike uncertain and unsafe."

**7th Letter.**—"Now, with regard to the analysis of materials for the use of the iron smelter (and without which analysis all his processes will be pursued in the dark,) the contents of his mines, limestones, coke ashes, and auxiliary fluxes—all in the state in which they are put into the furnace—should be correctly ascertained and duly tabulated for ready reference to at any time."

**8th Letter.**—"By the smelter obtaining a proper analysis of his materials, and by attending to the principle I have endeavored to enforce—i. e., to assort his mines and fluxes, so that the residuary earths shall readily fuse at the usual temperature of his blast furnace, into a clear and colorless glass, or cinder, without the aid of protoxide of iron—any furnace manager may regulate his process so as, at all times, to obtain whatever iron result he may desire. This has always been termed an impossibility—at least, by all the smelters of what may now be termed the old

school—and very probably it will continue to be so considered, until the iron masters will, as a body, hold out sufficient inducements to tempt individuals to properly qualify themselves, by a due course of education, for the important and responsible situation of blast furnace managers."

#### Smelting Copper Ores by Electricity, again.

We have published several descriptions of the new method of smelting copper ores by electricity. We have yet another to give. It is a French invention, by M. M. Dechaud and M. Gaultier de Claubry. These gentlemen had long been engaged on the effect of weak electrical currents on copper ores; and the following is an account of the results at which they had arrived before taking out their patent. The process consists of two operations—viz: roasting the ore, and the precipitation of the copper. The roasting is effected in a reverberatory furnace, either by conversion of the sulphuret into sulphate by the action of the air, or in the transformation of the oxide of copper into sulphate, by calcining it with sulphate of iron, at a dull red heat in a current of air—the iron being left in a state of peroxide. Washing, then, extracts the sulphate of copper—so that the most impure minerals will afford copper equally pure with the carbonate or oxides. In the precipitation by galvanism, batteries would be far too costly; and they have obtained the same results without the use of exterior batteries. The principle is as follows:—If two solutions is placed one over the other, one of sulphate of copper very dense, and the other sulphate of iron less dense, and in the first is placed a plate of metal, and in the second, a fragment of cast iron, and then unite these two metals by a conductor, the precipitation of copper commences at once, and is completed in a long or short period, according to the temperature, the concentration of the liquids, and the extent of metallic surfaces—the state of the copper becomes greatly changed as the liquor becomes weaker. To obviate this, they take advantage of the following phenomena: After some minutes' action, there exists four strata in the liquids; at the bottom is a dense solution of sulphate of copper, then a less dense solution of the same salt; next, a sulphate of iron, and on the surface a less dense solution of the same. If, therefore, we arrange at the level of each of these liquids suitable apertures for the addition or the removal of the liquid, they can be kept at a uniform state of density, and thus the copper is always pure, and in the same physical condition.

For convenience, the liquids are now arranged in vertical, instead of horizontal layers; they are now to be separated by a diaphragm very permeable to electricity, but not to liquids—pasteboard answers perfectly well for this, and lasts for months. The apparatus is then arranged as follows: A chest of wood, lined with lead or some suitable mastic, contains the solution of sulphate of iron; into this chest a number of cases are plunged, made of a frame having its ends and bottoms formed of iron plates coated with lead, the

sides being of pasteboard. The strong solution of sulphate of copper enters through a pipe near the bottom, and escapes in its weak state through an opening at the top; in each case is placed a sheet of leaded iron, and between each are plates of cast iron; separate rods connect each plate with the common conductor, which is supported over the apparatus, and the copper is precipitated on both sides of the sheet of metal, the pasteboard preventing the immediate contact of the two liquids; the sulphate of iron thus floats above the sulphate of copper, and the apparatus fulfills all that is required. At a temperature of 680 Fah. 1073 feet of surface will receive 15,444 grs. of copper in 24 hours, perfectly pure, and immediately fit for flammering or passing through the rolling mill. This manufacture of copper presents no difficulties, requires no refining, and gives no scoria. The patentees consider that as a metallurgical result, 50 per cent. of the copper is obtained in sheets; 25 per cent. in fragments which require fusion; and 25 per cent. of powder requiring subsequent refining. The application of galvanism to smelting appears to be reduced to the simplest form, and electrotypes on the largest scale can be obtained. —*Am. Mining Journal.*

**ATLANTIC AND ST. LAWRENCE RAILROAD.**—Notice to Contractors.—Proposals in writing will be received at the office of the Atlantic and St. Lawrence Railroad Company, in the city of Portland, until Tuesday, the tenth day of August next, inclusive, at sunset, for the grading, masonry, and bridging of that portion of their road extending from the termination of the second division near the hotel road in Danville, to a place in the vicinity of Norway and Paris cape, a distance of about 20 miles. Maps, profiles, and specifications will be ready for examination on and after the second day of August next, at the Engineer's office in Portland, where all necessary information will be given.

The company will require, as one of the stipulations of the contract, that the heavier work on any section, shall be first attended to, so that the heavier and lighter work may be completed at nearly the same time.

Persons unknown to the officers of the company must accompany their bids with satisfactory evidence of their ability to execute the work. In all cases good and sufficient bonds with two or more sureties will be required for the faithful performance and fulfilment of the contract.

Wm. P. PREBLE, *President.*

Portland, June 30, 1847.

3c28

**MICHIGAN CENTRAL RAILROAD.**—NOTICE TO CONTRACTORS.—Proposals will be received by the Subscriber until the 1st of August next, for the Grading of that portion of the Michigan Central Railroad lying between Antwerp and New Buffalo, a distance of 60 miles.

Profiles and specifications will be ready for examination after the 15th day of July next, at the office of the subscriber, or that of Col. J. M. Berrien, at Kalamazoo, at which time the line will be shown to contractors.

J. W. BROOKS, *Supt.*

Michigan Central Railroad Office,  
6126 Detroit, June 17, 1847.

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 130 tons 2½ x ½ inch Flat Punched Rails, 20 ft. long. 25 " 3½ x ½ " Flange Iron Rails. 75 " 1 x ½ " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, *Agent.*

Spikes are kept for sale, at Factory Prices, by L. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.  
ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers, etc., by JOHN A. ROEBLING, *Civil Engineer,* Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.  
2v19 17

## FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.  
Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the *Journal* of June, 1844.

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, *Agent.*

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
445 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trallis is 5 feet from centre to centre, while in the new construction they are only 2 1/2 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trallis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =		
68,696 ft. b.m., at \$10 =		\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =		
4,403 ft. b.m., at \$13 =		57 24
13,000 Spikes = 2,250 lbs. at 4 1/2 cts =		101 25
Workmanship free of patent charge =		690 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 336f

## LAP—WELDED WROUGHT IRON TUBES

FOR

## TUBULAR BOILERS,

FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address **J. M. HOWE,**

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

## ENGINEERS' AND SURVEYORS'

### INSTRUMENTS MADE BY EDMUND DRAPER,

Surviving partner of  
**STANCLIFFE & DRAPER.**

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

Road Depots, etc.

West Troy, May 13, 1847.

**ANDREW MENEELY.**

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**

12cf Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods, and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by **JOHN W. LAWRENCE,** 142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 321y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad. To all whom it may concern:—This is to certify that the New Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup' Motive Power

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4½	13 5	10	24 -		50	15-16	20
13	3½	9 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## RAILROAD SCALES.—THE ATTENTION

of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Philadelphia, Pa.

RAILWAY IRON.—THE BEST QUALITY  
of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2.

[1y4]

68 Broad St., New York.

## NICOLL'S PATENT SAFETY SWITCH—

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

ja45

Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 12th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

## VALUABLE PROPERTY ON THE MILL.

Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft, with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS, 48 State st.**, or to **CURTIS, LEAVENS & CO., 106 State st.**, Boston, or to **A. & G. RALSTON & Co., Philadelphia.** ja45

## TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.

## PASCAL IRON WORKS.

## WELDED WROUGHT IRON TUBES

From 4 inches to 4 ft in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PLANS.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**

Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

## TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.

Pascal Iron Works, Philadelphia. Welded Wrought Iron Tubes, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 117

## PATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
1y10 New York.

### LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron only*. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

4tf

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

26tf

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

1y

### LAP-WELDED WROUGHT IRON TUBES

for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,  
12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

28tf

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

### CONCORD RAILROAD.—PASSENGER

Trains in connection with the Lowell & Nashua Railroads, run daily between

Concord and Boston, Sundays excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

26tf

N. G. UPHAM, Supt.

### NEW YORK AND ERIE RAILROAD LINE

SUMMER ARRANGEMENT. For passengers, twice each way daily, (except Sunday,) leave New

York from the foot of Duane St. at 7 o'clock, A. M. and at 4 o'clock, P. M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A. M. and 4 15, P. M.; Middletown at 7 A. M. and 4 40, P. M.; Goshen at 7 22, A. M. and 5 3, P. M.; Chester at 7 35, A. M. and 5 18, P. M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For Milk—Leave Otisville at 5½ o'clock, morning and evening.

For Freight—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P. M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P. M.

Freight for New York will be taken by the trains leaving Otisville at 10½ o'clock, A. M.; Middletown at 11½, A. M.; Goshen at 12½, P. M.; Chester at 1 o'clock, P. M., etc., etc.

For farther particulars, apply to J. F. CLARK-SON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

24tf

H. C. SEYMOUR, Sup't.

### WESTERN RAILROAD.—ON AND AFTER

Monday, April 5, 1847, the passenger trains will leave daily, Sun-

days excepted, as follows:

Boston at 8 a. m. and 4 p. m. for Albany.  
Albany at 7 1-4 a. m. and 5 p. m. for Boston.

Springfield at 8 1-2 a. m. and 1 p. m. for Albany.  
Springfield at 8 1-2 a. m. and 1 1-2 and 3 p. m. (or on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a. m., and arrives in New York at 7 p. m., by the steamboats Traveler, New York, or Champion. Returning, leaves New York at 6 1-4 a. m., and arrives in Boston at 7 p. m.

Night line to New York.—Leaves Boston at 4 p. m., and arrives in New York at 5 a. m.

Albany and Troy.—Leave Boston at 8 a. m., Springfield at 1 p. m., and arrive in Albany at 6 p. m.; or leave Boston at 4 p. m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p. m.

The Troy trains connect at Greenbush.

The trains for Buffalo leave at 7½ a. m. and 7 p. m. For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 8 1-4 a. m., 1 and 3 p. m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Sup't and Eng'r.

C. A. SEAD, Agent, 27 State street, Boston.

### BOSTON AND PROVIDENCE RAIL-

road. Passenger Notice. Summer Arrangement. On and after Mon-

day, April 5, 1847, the Passenger Trains will run as follows:

Steamboat train via Stonington.—Leaves Boston every day, except Sunday, at 5 o'clock p. m.

Accommodation Trains.—leave Boston at 7 and 10½ a. m. and 4 p. m., and Providence at 7½ and 10½ a. m. and 4½ p. m.

Dedham trains, leave Boston at 8 a. m., 12½, 3½, 6½ and 9 p. m., Leave Dedham at 7 and 9½ a. m. and 2½, 5½ and 8 p. m.

Stoughton trains, leave Boston at 11½ a. m. and 5½ p. m. Leave Stoughton at 7 10 a. m. and 3½ p. m.

All baggage at the risk of the owners thereof.

25tf

W. RAYMOND LEE, Sup't.

### NEW YORK & HARLEM RAILROAD

CO.—Summer Arrangement.—On and after

Tuesday, June 1st, 1847, the cars

will run as follows, until further notice. Up trains will leave the City Hall for—

Yorkville, Harlem and Morrisana at 6, 8 and 11 a. m., 2, 2 30, 5 and 7 p. m.

For Morrisiana, Fordham, Williams' Bridge, Tuckahoe, Hart's Corner and White Plains, 7 and 10 a. m., 4 and 5 30 p. m.

For White Plains, Pleasantville, Newcastle, Mechanicsville and Croton Falls, 7 a. m. and 4 p. m.—

Freight train at 1 p. m.

Returning to New York, will leave—

Morrisiana and Harlem, 7, 8 20 and 9 a. m., 1, 3, 4 30, 6, 6 28 and 8 p. m.

Fordham, 8 08 and 9 15 a. m., 1 20 and 6 15 p. m.

Williams Bridge, 8 and 9 08 a. m., 1 10, 6 08 p. m.

Tuckahoe, 7 38 and 8 25 a. m., 12 55 and 5 52 p. m.

White Plains, 7 10 and 8 35 a. m., 12 50, 5 35 p. m.

Pleasantville, 8 15 a. m. and 5 15 p. m.

Newcastle, 8 a. m. and 5 p. m.

Mechanicsville, 7 48 a. m. and 4. 48 p. m.

Croton Falls, 7 30 a. m. and 4 30 p. m. Freight

train at 10 a. m.

Freight train will leave 32d street for Croton Falls

and intermediate places, 4 a. m. and City Hall 1 p. m.

Returning, leave Croton Falls 10 a. m. and 9½ p. m.

ON SUNDAYS, the trains will run as follows:

Leave City Hall for Croton Falls, 7 a. m., 4 p. m.

Croton Falls for City Hall, 7 30 a. m., 4 30 p. m.

Leave City Hall for White Plains and intermediate

places, 7 and 10 a. m. 4 and 5 30 p. m.

White Plains for City Hall, 7 10 and 8 35 a. m.,

12 30 and 5 35 p. m.

Extra trains will be run to Harlem, Fordham and

Williams Bridge on Sunday, when the weather is

fine.

The trains to and from Croton Falls will not stop

on N. York island, except at Broome st. and 32d st.

A car will precede each train 10 minutes to take

up passengers in the city.

Fare from New York to Croton Falls and Somers

\$1, to Mechanicsville 87½c., to Newcastle 75c., to

Pleasantville 62½c., to White Plains 50c. 25tf

### LONG ISLAND RAILROAD COMPANY.

Summer Arrangement. On and after Monday

May 1st, trains will run as

follows, except Sundays:

Leave—Brooklyn at 9 1-2 a. m. for Farmingdale,

1 1-2 p. m. for Greenport, at 4 p. m. for Farmingdale.

Leave Farmingdale at 7 a. m. for Brooklyn, 12 m.

do., at 3 1-4 do. do.

Leave Greenport at 8 1-2 a. m. for Brooklyn.

Leave Jamaica at 8 a. m. for Brooklyn, at 1 p. m.

do., at 4½ p. m. do.

On Saturdays, a train will leave Brooklyn for

Yaphank, at 4 p. m. Leave Yaphank, on Mondays

for Brooklyn at 5 1-2 a. m.

On and after May 15th, and until September 1st,

1847, a train will leave Jamaica at 7 a. m. for Brooklyn—

leave Brooklyn at 6 p. m. for Jamaica, and will

land and receive passengers at any place between

Brooklyn and Jamaica.

On Sundays—leave Brooklyn at 8 1-2 a. m. for

Farmingdale; leave Farmingdale at 4 p. m. for

Brooklyn.

Freight Trains—leave Brooklyn at 10 a. m. for

Greenport; leave Greenport at 12 m. for Brooklyn.

Baggage crates will be in readiness at the foot of

Whitehall street, to receive baggage for the several

trains, 30 minutes before the hour of starting from

the Brooklyn side.

The steamer "Statesman," Captain Nash, leaves

Greenport for Sag Harbor on the arrival of the Accommodation train from Brooklyn.

25tf DAVID S. IVES, Sup't.

### PATERSON RAILROAD

Summer Arrangement.

Commencing April 20th, 1847, the cars will leave

Paterson at New York at

8 o'clock a. m. 9½ o'clock a. m.

11½ o'clock a. m. 12 1-4 o'clock p. m.

4 o'clock p. m. 5½ o'clock p. m.

On Sunday.

8 o'clock a. m. 9½ o'clock a. m.

4 o'clock p. m. 5½ o'clock p. m.

Office 75 Courtlandt St.

Leave Boston at 7 A.M. and 2½ P.M.  
Leave Portland at 7½ A.M. and 3 P.M.  
**GREAT FALLS TRAIN.**  
Leave Boston at 5 P.M.  
Leave Great Falls at 6½ A.M.

**HAVERHILL TRAINS.**  
Leave Boston at 11½ A.M. and 6:20 P.M.  
Leave Haverhill at 6½ A.M. and 4½ P.M.

**READING TRAINS.**  
Leave Boston at 8½ A.M. and 8½ P.M.  
Leave Reading at 6 A.M. and 1½ P.M.

**MEDFORD BRANCH TRAINS.**  
Leave Boston at 7½, 11½ A.M., 2½, 5½, 7 P.M.  
Leave Medford at 6½, 8 A.M., 1½, 4½, 6 P.M.  
The Depot in Boston is on Haymarket Square.

Passengers are not allowed to carry Baggage above \$50 in value, and that personal, unless notice is given, and an extra amount paid, at the rate of the price of a Ticket for every \$500 additional value.

1y31 CHAS. MINOT, Super't.

**NORWICH AND WORCESTER RAILROAD.**  
Road. Summer Arrangement. Change of

Hours. Commencing on  
Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.)  
Leave Norwich, at 6 a.m., and 4½ p.m. Leave  
Worcester, at 8½ a.m., and 4½ p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2½ p.m. train from Boston.

New York Train via Steamboat.—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6½ p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6:30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars. 32 ly

J. W. STOWELL, Supt

**PHILADELPHIA AND READING RAILROAD.**  
Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A.M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A.M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92	\$3.50 and \$3.00		
" "Reading, 58	2.25 and 1.90		
" "Pottsville, 34	1.40 and 1.20		

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

**PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.**

## Summer Arrangement.

Philadelphia for Baltimore.....8 a.m. and 10 p.m.  
Baltimore for Philadelphia.....9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3½ p.m. } No line on Sun-  
Leave Baltimore at 3 p.m. } day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,

Engineer and General Superintendent.

**CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.**  
On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland.

WALDO HIGGINSON, Agent.

**NEW YORK AND PHILADELPHIA RAILROAD line.—direct.**  
Via Newark, New Brunswick, Princeton, Trenton,

and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

## FARE BETWEEN NEW YORK &amp; PHILA.

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York.

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD.—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freepport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon.....\$1 00  
" " " "Xenia.....1 50  
" " " "Springfield.....2 00  
" " " "Columbus.....4 00  
" " " "Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

47½ W. H. CLEMENT, Supt.

**BALTIMORE AND OHIO RAILROAD.**  
MAIN STEM. The Train carrying the

Great Western Mail leaves Baltimore every morning at 7½ and

Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Piusburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 26 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

## WASHINGTON BRANCH.

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 31 ly

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1-25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35 ly

**CENTRAL AND MACON AND WESTERN** Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190  
Macon to Atlanta—Macon and Western ..... 101  
Atlanta to Oothcaloga—Western and Atlantic.. 80  
Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	To Atlanta.	To Oothcaloga.
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	\$0 50	\$0 75
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 50	0 62 1/2
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20	0 26
Crockery, per cubic foot.....	0 15	" 35
Molasses and Oil, per bhd., (smaller casks in proportion).....	9 00	13 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		
Goods consigned to the subscriber will be forwarded free of Commissions.		
Freight may be paid at Savannah, Atlanta or Oothcaloga.		
F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846.		1y34

**CENTRAL RAILROAD—FROM SAVANNAH** to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods..... 13 cts. per cubic ft. On brls. wet (except molasses and oil)..... \$1 50 per barrel. On brls. dry (except lime)..... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred. On hhd. and pipes of liquor, not over 120 gallons..... \$5 00 per bhd. On molasses and oil..... \$6 00 per bhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A** Passenger Train runs daily from Charleston, on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculumbia Railroad in N. Alabama. Fare through from Charleston to Montgomery daily..... \$26 50 Fare through from Charleston to Huntsville, Decatur and Tusculumbia..... 22 00 The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

**GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.** AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO OOTHCALOGA, 80 MILES. This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 368 miles in length, from Charleston to Oothcaloga on the Oostenaula River, in Cass Co., Georgia.

RATES OF FREIGHT.		Between Augusta and Oothcaloga and Dalton.	Between Charleston, Oothcaloga and Dalton.
		250 miles.	365 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....		\$0 16	\$0 26
2d class. Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.		1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.		0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....		0 45	0 70
Cotton, per 100 lbs.....		0 45	0 65
Molasses, per hoghead.....		8 50	13 50
" " barrel.....		2 00	3 25
Salt per bushel.....		0 17	
Salt per Liverpool sack.....			95
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.....		0 75	1 37

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight may be paid at Augusta, Atlanta, or Oothcaloga.

J. EDGAR THOMSON, CA. Eng. and Gen. Agent. Augusta, Sept. 2d, 1846. \*44 1y

**GREAT SOUTHERN MAIL LINE VIA** Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans. The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4 P.M., Philadelphia at 10 P.M., and Baltimore at 6 A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston..... \$31 00 " " " Richmond..... 6 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to 1y14 STOCTON & FALLS, Agents.

**THE WESTERN AND ATLANTIC** Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer. Atlanta, Georgia, April 16th, 1846. 1y1

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## ENGINEERS and MACHINISTS.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, August 7, 1847.

### Canadian Railways.

We have the pleasure of inserting, in this number of the Journal, the Notice to Contractors of the "GREAT WESTERN," Canada, Railroad Company, for the "letting" of one hundred and fifty-five miles of their important work. This looks like going ahead with a rush, and like making up for the delay which has been so uncomfortable to the friends of the work. With good management, now that they are fairly in the field, we have reason to hope that the work will be soon completed.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

### Stony Brook Railroad.

We understand, says the Bunker Hill Aurora, that the contract for the grading, masonry, and superstructure of the Stony Brook railroad, has been taken by McCullough, Priehard & Co., and that the work will be shortly commenced. This road will connect Lowell with the Fitchburg, Peterborough, and Shirley, and Nashua and Worcester railroads, at the Groton depot.

### Spark Arrester of French & Baird.

The value of this appendage to the locomotive has been thoroughly tested, and found to surpass any thing of the kind, for that purpose, in use in this country. An evidence of the estimation of its value may be found in the fact that nearly four hundred of them have been made within the past four years. We saw six of them nearly completed, on a visit to the manufactory, a few days since, to fill an order for the "Cardenas Railroad," in Cuba—another order was recently filled with nine of them, made of copper, for the "Havanna and Guienas Railroad," on the same island—and fifteen others were sent to the different roads in Cuba last year. These spark arresters are also, we understand, very generally used on the railroads in the southern states, where cotton is transported. They are almost a certain preventive of accidents by fire from sparks, as well as a great relief to passengers—and should be used on every locomotive in the country. There has not been, we understand and believe, a single accident from fire, arising from the sparks from the locomotive where this arresters has been used—while on some roads fires, causing great loss of property, were not uncommon before the introduction of the "Spark Arresters" of French, Baird & Campbell, of Philadelphia.

### Railroad Brakes.

We have deemed this subject one of great importance, and have therefore often referred to it, and published accounts of what have been termed "improved brakes," from the English Journals.

The following communication is from a gentleman who desires its publication, yet declines to give his name for the present. We comply with his request, as we hold that every inventor should judge for himself when, and how, to bring his inventions before the community; yet we assure him that, if he has such a "brake" as he anticipates, we shall not allow him to keep it long to himself. Such a machine is too much needed on our numerous railroads, and will be too highly prized, to be allowed to remain long out of use. The writer says:

"Having observed in your valuable Journal, from time to time, articles on the railroad car brake, I intrude myself upon your notice to state that about eighteen months ago I took this subject into consideration, and devoted a good deal of thought to it, the result of which was the perfecting of a plan by which every car in a train—of no matter what length—can be effectually and instantaneously braked at the will

of the engine man, and without the aid of any other person.

"Everything desirable in a brake is combined in this plan, and the cost of attaching it to each car would not exceed \$6, or thereabouts—a very small item when compared with the losses sustained so frequently from accidents which this brake would entirely prevent.

"My peculiar situation has hitherto kept me silent on the subject; but should any person desire it, I would cheerfully enter into arrangements for the introduction of this brake upon the different railroads in the country. Truly yours, L."

### Coupling for Railroad Cars.

We find the following description of an improved coupling for railroad cars in the Baltimore Clipper, of 31st July. If it is, as represented, it should be better known, and in general use—as many serious accidents have occurred from the difficulty of detaching the cars from the train. If the inventor will send one of them to the office of the Railroad Journal, as a sample, we will—if it proves to be what it is represented—do our best to aid in its introduction upon all the railroads. The Clipper says:

"Mr. A. G. Heckrote has recently patented a new machine for the coupling of railroad cars, which promises to be of great utility. In addition to the ordinary coupling box, a flat roller, a tumbler similar to that of a gun lock, a dog and a spring, are attached, all made of cast iron, except the spring, and weighing about 100 lbs. It is self-acting, so that two cars can be coupled without the danger usually attendant on the old plan. The machine has play sufficient for any curve or angle of a switch; but in case of a car running off the track, it instantly detaches all the cars behind; and any car or number of cars can be detached at pleasure, by a slight pressure of the spring, by the hand or foot, without stopping or impeding the cars or locomotive in front. The expense of a machine is from \$6 to \$10, and it will, no doubt, supersede the old fashioned bolts and chains. One was tried on the Washington Branch road for twelve days, and found to answer every purpose for which it was designed. A machine similar to this would have avoided many accidents and consequent loss of life, which have frequently resulted from whole and parts of trains of cars running off the track, as well as many which have occurred from the old manner of coupling, when stationary."

**Lebanon Springs, N. Y., and Bennington, Vt. Railroad.**

We have, more than once before, called attention to the importance of a railroad from the Western Massachusetts railroad, at or near Canada, by the way of Lebanon Springs, to Bennington, and thence to Rutland, in Vermont, thus opening a direct communication between the Housatonic railroad and the Harlem railroad, when it shall—as it will—find an outlet at the north. There is a rich and fruitful valley, with easy grades and abundant water power, where a railroad may be easily constructed, and then well supplied with a profitable local business, in addition to a large through business, when there shall be an uninterrupted line from the city of New York to Burlington, and to Ogdensburg, and to Montreal, as will soon be the case, either through this valley, or by the way of Pittsfield and North Adams, and thence to Rutland.

The trade of western Vermont is too important a matter for the merchants of New York to give it up to Boston without an effort; and therefore a railroad will be constructed by which that trade may reach New York direct, and then for a fair competition. It therefore stands our friends, at Lebanon Springs, in hand to move early and earnestly in the matter.

The following extract from a letter from a gentleman at the Springs, says:

"You will, I hope, again indulge me in a remark or two in relation to the hope we cherish—that one day our valley will supply a link in the great railroad which will connect New York with Montreal, Quebec and Ogdensburg. We are watching the progress of the several roads north and south of us, and it is gratifying to see the Harlem railroad rising in public estimation. So far as we are interested, it will serve our purpose if this road forms a junction with the Housatonic, where I have marked on the enclosed map—from the Canaan Flat Brook we have a survey to the Springs, eight miles, by a competent engineer, showing a grade in no case exceeding forty-one feet to the mile, and in one or two instances, only coming in the neighborhood of that elevation. The grade from Lebanon Springs to Bennington, Vt., is much less than that maximum, pursuing, as it does, a direct course through a great valley the whole distance, some 25 or 30 miles."

From this it will be seen that the route is exceedingly favorable, and only requires a little effort to carry it through, and we trust that that effort will be effectually made at an early day.

**Railroads in North Carolina.**

The Fayetteville (N. C.) Observer says, that immediate steps are to be taken to raise a fund for making a survey of the route for the railroad from Raleigh to Camden, under the superintendence of a corps of engineers, to be selected by the capitalists of Boston, who have purchased the Portsmouth and Roanoke road, and who are about to extend that road to the Raleigh and Gaston road. On the 15th instant, books of subscription were opened at Weldon, to the stock of the company, chartered by the North Carolina Legislature, to fill the space from the present termination of the Portsmouth road to and by Weldon to the Gaston road. A sufficient amount was promptly subscribed by the citizens and the Boston company, and the first instalment paid in. A partial survey of the route has already been made, and it is supposed that the junction will be made at a point near Littleton, on the Gaston road. A meeting of the stockholders will soon be held, and the company organized by the appointment of officers. It is expected that this road, in first rate order, will be ready for next spring's travel.

**Ocean Steam Ships.**

A friend and correspondent in London asks us "How does it happen that the steam ship Washington, which is to leave New York on 1st of June for Bremen, has so much more 'horse power' than English steam ships of equal, or greater tonnage? Has not the advertisement respecting the Washington, announced that she has more horse power than tonnage, or as much? Is the mode of measuring horse power different in America from that used in England, as is the case in regard to tonnage?"

We find, by referring to the advertisement of the Washington, that the tonnage is put down at 1750, and her power at 2000 horse—or "two engines of a thousand horse power each."

The mode of estimating "a horse power" is the same, we believe, in both countries, viz:—though in our estimation it is not always accurate.

The power of the Washington to her tonnage is greatly disproportionate, in comparison with English ocean steam ships, if those built and building for the "Peninsular and Oriental steam navigation company" are any criterion. By the report of this company, made at their last half-yearly meeting, we observe that since the previous "meeting of the proprietors the following vessels have been despatched by the directors to India and China, viz:

	Tons.	Horse power.
The "Haddington".....	1,647	500
" "Pekin".....	1,182	430
" "Pottinger".....	1,401	500

This addition to the company's ships in the east will greatly improve the efficiency of the establishment, and give a more permanent character to its operations in that quarter. The directors intend to follow up these arrangements, by placing two additional vessels in the Indian seas. And for this object, they have made contracts with Messrs. Pitcher, for two timber ships of 1,205 tons each; and engines by Messrs. Miller, Ravenhill, & Co., of 450 horse power each; Messrs. White, of Cowes, are also building for the company one vessel of 900 tons, to be fitted with engines of 350 horse power. In addition to the foregoing, the following vessels are in course of completion, and will be added to the company's fleet this year, viz:—

	Tons.	Horse power.	Ready for sea.
The "Indus".....	1,220	500	June, 1847.
" "Trafalgar".....	1,000	400	July, 1847.
The "....."	1,040	400	Oct., 1847.
The "....."	1,220	500	Dec., 1847.

From this it appears that the power compared with the tonnage is less than half—while in the Washington it is naturally greater.

We should like to hear from some of our readers, interested in and familiar with the subject.

**Louisa, Va., Railroad.**

We are indebted to Col. Fontaine, says the Richmond Republican, for a copy of the proceedings of the twelfth annual meeting of the stockholders of the Louisa railroad company. We shall make a more extended notice, as soon as we are able to examine its proceedings.

We are glad to see the increasing interest manifested by the people of Albemarle, Rockingham, etc., in regard to the Louisa extension. But what are our good friends of Augusta doing? Surely they cannot be insensible to the importance of earnest and speedy action.

The affairs of the company have been conducted with the greatest skill and prudence, under the auspices of Col. Fontaine, its able, sagacious, and energetic president.

We have never yet seen a report of this company. (Ed. R. R. J.)

**The Iron Trade.**

The London Mining Journal, of 25th June, says that the average price of rails was £9 and £9 5s.—and that Scotch pig in the Clyde was £3 3s. and £3 5s.

The Glasgow pig iron trade was dull. A lot of mixed Nos. was forced on the market under peculiar circumstances, and brought 64s. 3d.—cash.

On the 2d of July the quotation for rails was £8 15s.: yet the reports from Glasgow and South Staffordshire were better than the previous week—as will be seen by the following extracts from the Mining Journal, of 3d July:

*Glasgow Scotch Pig Iron Trade, July 1.*—The business done in pig iron for the last week has been very limited. The market opened rather more firmly this week, and the subsequent accounts of a falling grain market have confirmed an improvement in prices. Some sales have been made at 65s. and 65s. 6d., cash, for mixed Nos. To-day we have buyers at 65s. 6d., and sellers at 66s. 6d. cash.

*South Staffordshire.*—The prospects of the staple trade of South Staffordshire for the ensuing quarter are extremely flattering, and the downward tendency of the corn market, accompanied by the probability of an early and abundant harvest, have inspired confidence in the minds of those most interested in this important branch of commercial and industrial enterprise. The preliminary meeting of the iron masters, in an anticipation of the general quarterly meetings which are held, at stated times in various parts of the district, was held yesterday, at the Stewpony Inn, near Stourbridge. It was very numerously attended by the influential members of the trade, and we are happy to state that the gloomy forebodings of railway repudiation have not been realized. The trade was represented as peculiarly firm in its aspect—the orders were abundant, and a virtual resolution to support the present prices was unanimously agreed to. The formal meetings of the trade will be held next week, and we are led to anticipate from the activity which has prevailed during the last quarter, and the healthy state of trade throughout the district, that the result will be satisfactory both for past and future.

**Railway Compass.**

It is stated in an English paper that an instrument has been invented which will "at all times show the speed of the engine, the distance to the next station, and the position of the train on the line. A chronometer connected with it shows the railway time. It will note the time occupied at each station, and the speed of each mile, on a paper, which can be taken off and filed. One index on the dial points to the place which corresponds to the one on the railway; another indicates the speed; a third revolves once in 10,000 miles, showing what distance the engine has travelled. This instrument is moved by a separate wheel running on the rail, is not affected by breaks, and being illuminated at night, is easily seen by the engineer. The experiment has been successfully tried, fully realizing the anticipations of the inventor."

This may be a very useful instrument, but we would give more for a good "brake,"—such an one as is spoken of by our correspondent "L." in another column, than for a dozen such instruments.

**Atmospheric Railway.**

We regret exceedingly to hear the following admission from one who has watched the progress of this beautiful system, and who has formerly had great confidence in its ultimate success. He says,

"I am afraid the practical difficulties respecting the atmospheric railway are not sufficiently overcome to make it an economical mode of traction. The Croydon atmospheric is given up, and—although some papers say that the 'South Devon' and the 'French' atmospheric are doing well, Herapath says the contrary.—It is impossible to come to any conclusion on the subject. The Kingston and Dublin atmospheric certainly does well."

## INSTITUTION OF CIVIL ENGINEERS.

Who can estimate the benefits resulting to science, and to the profession, from this noble institution in England? At almost every meeting some valuable paper is read by some one of its members, and speedily published in that excellent periodical the *Civil Engineer and Architects Journal*. Through the instrumentality of this institution, the discoveries and improvements of the numerous able men of the country are brought under consideration and discussion, and then given to the public in a manner which commands respect and confidence.

So highly is it estimated in Europe, that a similar institution is to be established in France, under the auspices of the minister of public works—and we trust that ere long we may have one established in this country.

We find the following article on the difficulties of "bridge building" in Holland, in the number for April of the *C. E. & A. J.* It was read at the meeting of 16th of March, by the CHEVALIER CONRAD.

The paper read was "*A description of the method adopted in Preparing the Foundations and in Building the Bridge over the Polder vaart, on the line of the Amsterdam and Rotterdam Railway.*"—By the Chevalier Conrad, M. Inst. C. E., compiled by Mr. C. Manby, secretary, from documents furnished by Mynheer Wenckebach.

This bridge derived its importance from the peculiarly treacherous nature of the ground upon which it was constructed, for, although in Holland bad foundations are the rule rather than the exception, the difficulties were in this case so peculiarly great, as to demand particular notice. The Polder vaart is a canal encompassing and conveying away the waters from the Polders, or spots of drained land in the commune of Kethel. The railway, traversing it at a considerable angle, rendered a skew bridge, of three openings, necessary—the centre one 13 feet space for the navigation, and the two side arches 21 ft. space each, for the drainage water. The proceedings were commenced in the usual manner, with the intention of having separate foundations for each pier; this was by shooting in large quantities of sand, to form dams, within which, when pumped dry, the foundations would have been excavated.—After a length of about 70 feet of sand, a dam 10 feet deep had been filled in, without exhibiting any signs of sinking; a heavy thunder storm occurred, during which the whole mass of sand dam was suddenly engulfed to the depth of 20 feet; while there arose simultaneously, at a short distance down the canal, to above the water level, a mass of bog earth, of an area of 4989 square feet—this mass increasing at subsequent periods of the proceedings to the area of 9628 square feet. It was evident that an extensive subterranean shifting of the bog earth had occurred, and there was reason to fear for the safety of the adjacent dykes and other works.—Piling and facine works were tried without success: piles of 70 feet in length, when driven and tied together, by waling pieces, swerved bodily from their position, and became useless; fascines equally failed in producing stability. The engineer, therefore, determined, after directing the canal water in-

to a side cut, to surround the site of the intended foundation with mounds of sand, allowing for their subsidence in the gulf below and then squeezing up the bog earth around and within the spot. This was at length completed, and the foundation pit was enabled to be pumped dry. It then became necessary to remove all the bog earth from within the space for the foundation, which was accomplished by digging out spaces of a yard square, and filling them in with sand as they proceeded, until, by commencing at the exterior, and working inwards to the centre, all the bog earth was removed, and a bed of sand had been formed in its place. The piles for the ordinary foundation used in Holland, were then driven through the made ground, and the structure was completed with perfect success: the sand dams, and the masses of upraised bog earth outside, being subsequently dredged up in the ordinary manner, to restore the canal to its original bed. In this description, the circumstance most deserving attention, appeared to be the sudden rising of the bog earth during a thunder storm. This is, however, of frequent occurrence in Holland; and it would appear as if the adhesion of the masses of bog earth to the bottom was so slight, that the vibration communicated to the water by the thunder, sufficed to destroy the equilibrium, and the bog turf, which, from its slight specific gravity, will float even when wet, instantly rose to the surface; when therefore, as in this case, a heavy mass of sand was placed in the vicinity of such bog earth, the bottom was unable to resist the pressure, and the least vibration caused it to break through the crust, being engulfed amidst the lighter material, which it forced up in the direction of the least resistance. The paper treated at some length on all the precautions necessary in this and similar constructions in Holland, where such bad foundations are of very constant occurrence. In the discussion which ensued, descriptions were given of the simpler methods employed in similar situations in England, where bridges of greater weight and space were constructed upon foundations of nearly as treacherous natures: for instance, on one of the branches of the Norfolk railway, for a bridge of which the swinging portion weighed 100 tons, a series of 16 piles, driven 50 feet deep into the silt in 12 feet water, supported a cast iron kirk, upon which a cast iron close jointed cylinder was lowered and secured; within this the centre foundation was built and had stood perfectly.

Other instances of raft, or floating foundations, common in Lincolnshire, were adduced, showing the simple means by which such local difficulties were overcome in England.

## The Connecticut River Railway.

We find in an exchange paper the following article in relation to the *Connecticut River Railway*. It gives an interesting and cheering view of the progress of that important link of railroad which is destined to connect the cities of New York, New Haven, Hartford and Boston, with Montreal and Quebec—which, indeed, is to intersect the numerous important lines of railroad from the Atlantic cities,

New York and eastward, to the Canadas—to Burlington, Ogdensburg, Rutland, Whitehall and Albany.

The editor of the *Springfield Republican* speaks from personal knowledge, as he lives in the very heart of the Connecticut valley—yet we may be allowed to give an opinion in relation to the same matter, as we can also speak of that region of country from long personal knowledge.

It is true, as he says, that "the Connecticut valley is the *Garden of New England*;" and it is destined to become—if it is not now so—and remain the most populous part of the Union. It will produce and send to market annually a greater value of property than any other region of equal extent, and consequently there will be more passengers passing over it than over any other road in the country, except between large cities, and except also between those cities and the great west—and therefore the Connecticut River railway will become—and that, too, in a few years—one of the most productive railroads in the country. Let those, then, who are immediately interested in it, lose no time in pressing it forward to a speedy completion. The editor says:

"We have lately directed some attention, and in turn would earnestly invite that of the public generally, and more particularly of that large portion of New England which lies along the *Valley of the Connecticut*, to the importance of speedy action on the subject of that line of railroad communication, which, extending from the northern boundary of New England to the city of New York on the south, and northerly to the cities of Montreal and Quebec, forms what may emphatically be called, the *Connecticut River Railway*."

"Of the many important lines of railroad, now constructed or in progress of construction in New England, there is none perhaps which touches the interests and important interests too, of so widely extended a population, as does this. It passes through the heart of the country, and in one of the most populous and richest valleys of our land; and may, when brought to perfection, unite upon it an amount of business, the extent of which can scarcely be realized at this time. We propose to state a few facts, showing the present position of the line as a railway communication, and exhibiting in a striking light the necessity and importance for early action to make its perfection sure and speedy."

"This line is about 488 miles in extent, and embraces at present several distinct lines of railway, all of which are completed or in rapid course of completion, with the single exception of the line between Greenfield and Bellows Falls, a distance of only about 40 miles."

"The importance of this connection may easily be seen by a slight inspection of the map of the country: and we invite the reader to make such an inspection. To aid and explain the examination, the following list of the roads, now completed and in progress of construction, and the lacking connection is given:

	Miles.
Montreal to Sherbrook.....	85
Sherbrook to Derby.....	30
Derby to White River.....	114
White River to Bellows Falls.....	40
Bellows Falls to Greenfield.....	40

Greenfield to Springfield.....	38
Springfield to New Haven.....	61
New Haven to New York.....	80

Total distance.....488

"Of this distance there are now completed and in actual operation, the lines from

New Haven to Springfield.....	61
Springfield to Greenfield.....	38

99

"And in the course of a year there will be completed the following additional portions:

Montreal to Acton.....	45
Wells River to White River.....	40
White River to Bellows Falls.....	40
New Haven to New York.....	80

205

"There will then remain to be completed, the lines from

Acton to Sherbrook.....	40
Sherbrook to Derby.....	30
Derby to Wells River.....	74
Bellows Falls to Greenfield.....	40

181

"Of these, the lines from

Acton to Sherbrook.....	40
Sherbrook to Derby.....	30
Derby to Wells River.....	74

144

will probably be completed in the year 1849—leaving the line from Bellows Falls to Greenfield alone unprovided for.

"A matter of such immense importance to the whole of this extensive territory—and this cannot fail now to appear so to every reflecting mind, who has accompanied us thro' this route as above—should not pass without attention. Immediate provision should be made for the connection of this line between Bellows Falls and Greenfield; and for this purpose we cannot believe that anything more is necessary, than that the subject should be fully presented to the public.

"We understand, and we rejoice to learn the fact, that arrangements are in progress for holding a convention of all the parties interested in this extension, or rather connecting line, at some central point, for the purpose of taking such measures as will ensure the construction of the work. We cannot permit ourselves to doubt the success of any rightly made efforts for this purpose, and we hope to see them promptly made, and vigorously carried forward.

"The success of the existing lines, independent of the immense aid which a thorough connection would give them, is such, even from their short experience, as to afford ample evidence of a high state of prosperity.—To substantiate this more fully, we have obtained some facts relative to the 'Connecticut River railroad,' extending from Springfield to Greenfield.

"This road paid dividends of interest to its stockholders up to near the close of last year, the time when it was completed. On the 1st of July instant, it declared a dividend of 3 per cent. from its net earnings, being its first semi-annual dividend.

"The roads in New England are very few that have so promptly met the expectations of their proprietors. Those which rival it in

this respect, enter Boston. But this road is in the country, remote from large cities. Its northern terminus is at present in a small town, of not exceeding 2000 inhabitants. Its success is owing to, and demonstrates most fully, the populousness and richness of the country through which it passes. The valley of the Connecticut is truly the garden of New England.

"The coming months of the year from July 1, are much richer in business and less in expenses, than the past six months. A dividend of 3 per cent. may therefore be relied upon for January 1, 1848. The second year will do better than the first, if the experience of other roads teaches aright.

"The number of passengers over the road on Monday, the 5th July, was nearly 8,000, which will compare well with the business of that day on railroads leading from Boston.

"About half way between Springfield and Northampton, the road passes through the heart of what is destined to become, at no very distant day, the largest manufacturing city of New England, commanding the entire water power of the Connecticut river. This property has just been purchased by wealthy capitalists, who will push forward improvements with great rapidity during another season.

"With Springfield and its 15,000 inhabitants at its southern terminus—with Northampton, so much frequented by travellers, at its centre—and with numerous literary institutions and with rich and populous villages throughout its length, the Connecticut River road cannot fail to do a large and remunerating business. The 'New City' is hardly needed to add assurance; nevertheless, it is rapidly coming into life, and will add astonishingly to the business of the entire valley.

"There is no reason to doubt, that the other roads of the valley will have an experience like that, which has fallen to the Connecticut river railroad, during the short time it has been in operation; and when the lines are all connected together into one grand chain, extending from Montreal and Quebec to New York city, the augmentation, which the travel between the extremities,—induced by necessity and convenience in winter, at least, and by pleasure in summer—the produce of the north seeking a southern market and returning goods of every description, will give to them, one and all, a place undoubtedly by the side of the most prosperous and profitable roads in the whole country."

#### Baltimore and Ohio Railroad.

Continued from page 485.

From other high sources in the State of Ohio, men eminent for their official rank and practical knowledge and experience, the committee have been assured, that both the government and people of Ohio require that the line of eastern and western connection by railroad through their State should be nearly central as possible, and that the nearer it could pursue the course of the National road, the more acceptable it would be, and the greater encouragement it would receive. The same sources reject a connection with

far off, and too remote for the great resources of the State, and they also reject Parkersburg, as being upon the other extreme.—They uniformly prefer Wheeling, or some point near it, and not remote from the National road; and they all concur in the opinion, that if this company should conclude to terminate their road at Wheeling, and begin in earnest to construct it to that terminus, the resources of these parts of the Ohio more particularly interested, would be immediately called into activity, and the great central line be promptly extended to the river opposite to that city.

The committee have felt it to be their principal duty to refer emphatically to this certainty of a connection with the western improvements, since, without such reliance, there could be little object in the expenditure of any amount of capital in reaching the Ohio river at any point. Those improvements, when, and wherever made, must ultimately supersede the river navigation for the purpose of travel, and materially interfere with the transportation of tonnage by the same channel; and any railway from the Atlantic seaboard, that does not reach the proximity of the great line of railway communication from the Ohio river throughout the valley of the Mississippi, will surrender the main object of the enterprise. The committee are not aware that information, more pertinent or more to be relied upon than that they have produced, could have been obtained. The cities of Columbus and Zanesville, and the State of Ohio generally can have no ground of preference for any road to the Atlantic but one founded upon the most direct and the cheapest line to market.

Of the minute, familiar knowledge of the subject in all its details, of their acquaintance with their own interests, and of their sagacity in adopting the best mode of promoting them, no one can doubt; and when all these great interests are found of universal accord in rejecting one route, as only to be forced upon them from necessity, and recommending another as certain to develop their own resources, and to ensure a communication between Cincinnati and the far west and Baltimore, it would seem to be unwise to reject their positive information, and resort to the region of speculation to find something better. It should not escape the attention of the Board that, while in the central and southern parts of the State of Ohio, there may be some difference of opinion whether the preference, as to the terminus of our road, should be at Wheeling, or Fishing creek, or Parkersburg, they all unite in one common, universal sentiment in discouraging and deprecating a terminus at Pittsburg, or at any point north of Wheeling; and it is worthy of remark, that such a universality of sentiment is strictly coincident with, and powerfully corroborative of, the views and preferences of the original projectors of this enterprise. Indeed, the committee would find it difficult to suggest or imagine a stronger incentive to the prosecution of the road to any given point on the Ohio river, than that in the enlightened opinion of the

great mass of the intelligence and practical experience of the western country, it would ensure an immediate connection with those improvements by which the travel and trade of the Mississippi valley were to be conducted to the Atlantic market.

Upon the present occasion, however, the terminus or termini of the Baltimore and Ohio railroad recommended by the committee, offer the additional advantage, that while they ensure an early connection with the western improvements, they also ensure the command of the trade and travel of the western country, whether pursuing the river navigation or the improvements on land, *without competition*. The distance from Columbus and Zanesville to Wheeling being nearly seventy miles less than to Pittsburg, by the most favorable route that has been suggested to the last named city, it must be obvious that the shorter and cheaper lines will be the first to be made, and equally so, that in the face of shorter and cheaper lines, it will not be easy to command the capital or find an adequate incentive to construct others, both larger and more expensive. No such expectation could be entertained, at least until the growth of the western country should indispensably require further improvements, even at a greater cost to supply its wants. The committee would also remark, without unnecessarily swelling this report with tables or details of distances, that by the proposed route to Wheeling, and thence by easy, practicable lines to Columbus, the distance thence to Baltimore would be considerably shorter than to Philadelphia by the way of Pittsburg. It is equally undeniable, that the river trade and travel, instead of working up the river ninety-six miles above Wheeling, and at so great a loss of time, would stop at the latter point, whence, in the average they could be conducted to *Baltimore* as soon as by the river they could be taken to *Pittsburg*. The committee entertain no doubt, that if the railroad should be completed to Wheeling, the trade and, if there be any, travel passing through the Ohio canals into the river between Pittsburg and Wheeling, would prefer dropping down to *Wheeling*, rather than encounter the delay of working up the stream to *Pittsburg*.

The committee are unwilling to quit this part of this subject, without calling the attention of the Board to the contrast which would be exhibited if, refusing to terminate their road at Wheeling, where they would engross the entire trade and travel without rivalry, if it were possible to force the western improvements and the contributions of the river to *Pittsburg*. At the latter point they would be in close and severe competition with the Central road to Philadelphia, for both passengers and tonnage at all seasons of the year, and of the fatal influence of such a competition upon the trade of this city and the income of the road, the committee need not stop to point out in detail. Its full extent will readily occur to an intelligent, impartial mind, who will take the trouble to reflect upon the subject. A single instance, however, may serve, in part, in illustration of the

mischiefs to which, in this connection, the committee have adverted. It is conclusively shown by the records of this company, and by those of the stage lines on the National road, that of the whole number of passengers coming from the Ohio by the road to *Baltimore*, at least *two thirds* are destined and proceed to Philadelphia and the north, without stopping in this city longer than to take a hurried meal. It then will be apparent, that if these and the expected increase should be forced to Pittsburg, they would naturally and unavoidably take the road to Philadelphia, where, by that line, they would arrive as soon and as cheap, as they could be brought to Baltimore, and in that way save the expense and time of travelling one hundred miles farther between the two cities.

It must be obvious, therefore, that, so far from increasing its travel under such circumstances, the Baltimore and Ohio railroad would lose at least two-thirds of that it now enjoys. If, on the other hand, our road should terminate at *Wheeling*, then allowing as an average of the year, fifteen hours to go by the river from *Wheeling* to *Pittsburg*, and it is believed to be less than the time actually consumed, the passenger by taking the railroad at *Wheeling* would arrive at Baltimore as soon as he could get to *Pittsburg*, and at Baltimore be within only one hundred instead of two hundred and thirty-seven miles of Philadelphia. He would have gained at least fifteen hours in time between Wheeling and Philadelphia, which would be more than sufficient to take him to New York! The same observation will apply, with proper allowance for time, to the trade and tonnage. It is obviously, therefore, the true policy of the company to arrest the trade and travel at *Wheeling*, instead of expending millions to force them to *Pittsburg*, to the fatal injury of the city, and the ruin of the road.

It would appear to the committee, therefore, that unless they have entirely mistaken the primary objects of the enterprise in which they are engaged, and greatly exaggerated the advantages of adopting a route free from competition with other cities, the expenditure of a much greater sum than the construction of the road to *Wheeling* will actually cost, would be fully warranted by the results to be expected from it. There would appear, however, to be a misapprehension of the actual cost of the route to *Wheeling*, as unaccountable as might be pointed out to have prevailed as to other parts of the subjects. It has been already shown, that the united energies of the Board, of the stockholders, and of the community have been for years exerted to terminate the road at a more southern point, for no greater advantage than, it is now seen, may be had at *Wheeling*, and that all interests would at any time have been satisfied with a terminus as low down as *Fishing creek*. Then, the actual cost of the road to *Fishing creek* with one track, is estimated by the engineer at the sum of \$5,240,250, and to *Parkersburg* \$6,690,000, and from neither point had we succeeded in reaching it, could we have counted upon any aid from *Wheeling*. The stockholders, however, at

their meeting on the 22d day of February last, authorized the acceptance of a law compelling the company to extend the road to *Wheeling* from the mouth of *Fishing creek*, with a substantial subscription from *Wheeling*, which would have swelled the entire cost of the road, by that route, to at least \$6,500,000.

Now the actual cost of the road to *Wheeling*, by the present law and arrangement with that city, according to estimates of the same engineer, will not exceed, with one track, \$5,900,000, and according to the estimate of another eminent engineer, will not be more than \$5,800,000; thus showing that the highest cost of the present route to *Wheeling* will be \$790,000 less than the road to *Parkersburg*, and \$600,000 less than the route preferred by the stockholders, to *Wheeling*, by the way of *Fishing creek*, and only \$659,750 more than the preferred route terminating at the mouth of *Fishing creek*!

But if the committee have succeeded in showing that all the advantages, and even more, as they believe they have done, are attainable by the route to *Wheeling* by the way of *Fish creek*, that could have been obtained from the route to the same point by the way of *Fishing creek*, then, by the route now recommended, the actual cost to the company will be at least \$600,000 less than by the former preferred route. Nor will it escape observation that, by taking the shorter route to *Wheeling*, by the way of *Fish creek*, instead of the longer and more expensive line by *Fishing creek*, the company have not only saved an actual outlay of \$600,000, but by receiving from *Wheeling* a contribution of \$500,000, and privileges supposed to be equal to \$50,000 more, the present proposed route to *Wheeling* will cost the company only \$109,750 more than they must have expended upon a route to *Fishing creek*, if they had made that their only terminus; from which, if the information now acquired can be relied upon, they could not have formed their western connection as certainly or as beneficially as they may from *Fish creek* and *Wheeling*.

It is to be added in this connection, that the cost of the proposed road, with one track, to *Wheeling*, is only \$900,000 more than the cost of the cheapest route to *Wheeling* through the State of Pennsylvania, under the old charter; and nearly \$700,000 less than the cost of that route added to the cost of the branch to *Pittsburg*, which the company consented to make for the privilege of terminating their main stem at *Wheeling*.

Without stopping here to institute a minute comparison between the route to *Wheeling* as now proposed, and that to *Pittsburg*, about the latter of which there is a material difference in the estimates of engineers, the committee content themselves with stating it as their opinion, from the best data in their power, that the actual cost of the road to *Wheeling* will not, under any circumstances, exceed that of the road to *Pittsburg* \$1,500,000; and if the lower estimates be found correct, or the cost of stocking a new road be taken into consideration, will most probably

little exceed a million of dollars. Assuming the largest estimated difference, the committee are of opinion, that in escaping from the severe competition with the rival roads of Pennsylvania, in the advantage of engrossing the whole trade and travel of central and southern Ohio and the States farther west, without rival, and in the largely increased trade and travel sure to be brought upon the road at *Wheeling*, the company would receive an equivalent far more than quintable any difference that will be found really to exist. The committee are, moreover, entirely persuaded that whatever might be expended upon a road to *Pittsburg*, would be given at most to equalize advantages between Baltimore and Philadelphia; whereas, by a terminus at *Wheeling*, they would engross the whole.

It has been no part of the duty of the committee to inquire into the means by which the road may be extended to the Ohio river, if the present law should be accepted. They are free to admit, that to raise the amount requisite for either will be a task of no light difficulty. They are to presume that this company and this community have not been engaged for twenty years in exertions to push their road to the best point on the Ohio river, without an earnest effort to accomplish the object; and that they will not now abandon the pursuit, when, for a sum less than that which in 1838 they undertook to procure, the right to finish the road is placed at the option. The committee are sensible, that whether the company should determine to make the road to *Wheeling* or to *Pittsburg*, neither could be accomplished without a liberal use of their credit; and they cannot doubt, that in aid of a road engrossing the unrivalled trade and travel, and general resources of the great west, they could use that credit to a greater extent and more efficiently, than for another of doubtful results, and doomed to struggle for any business whatever with other roads and other cities. Upon a road attracting the travel and trade of the west without competition, the committee cannot doubt that an immediate transportation, with a prospect of a large increase, of 400 passengers per day, in both directions, would be a reasonable estimate; and that number at \$10 per passenger, allowing the tonnage transportation to defray the expenses of working the road, would yield a net revenue of \$1,480,000 per annum, or nearly twelve per cent. upon the entire cost of the road from Baltimore to *Wheeling*. The committee do not deem it unreasonable to expect, therefore, that upon such a basis they would be able to invite capitalists to engage in the enterprise, and press it forward.

It has been shown, that besides the contribution from *Wheeling*, the actual cost of the road with one track, may be estimated at \$5,350,000. If the company should be successful, which, with the aid of a united community at home, and the co-operation of *Wheeling* in Virginia, they believe not improbable, and that commonwealth should make her usual contribution of 25 of the cost of the road in the State of Virginia, the bal-

ance would constitute a sum quite within the reasonable resources of the company. Even should that expectation fail, however, it would not be unreasonable to expect this community to co-operate, in the prosecution of an enterprise which, in the opinion of the committee, the more it is examined the stronger will its claims upon the cordial co-operation of this community appear.

The committee, therefore, believing that, under the present law and the arrangement concluded with *Wheeling*, the road may be prosecuted to the Ohio as advantageously as it could have been at any former period; and in all probability more so than if further time should be devoted to procure further grants from Virginia, have unanimously concurred in recommending the acceptance of the present law, and the ratification by this company of the agreement herewith submitted.

In conclusion, they propose, that the Board should convene the stockholders at the earliest practicable day, and recommend to their acceptance the recent act of the Virginia Legislature, and the ratification of the agreement with *Wheeling*.

#### Electric Telegraph.

We are indebted, says the London Mining Journal, to a correspondent for the following chronological history of the science of electricity—the discovery, and improvements made in it for the last 200 years, down to the magnificent and first successful adaptation of it to telegraphs, by Professor Morse, of the United States. No branch of experimental philosophy (our correspondent remarks) has been so much neglected as that of electricity; indeed, until the 17th century, little or nothing was known of it.—In the year

1600—Mr. Gilbert, of Colchester, published a treatise in Latin, of various experiments made by him; but his theory was very imperfect, though he increased the list of electric bodies, and also of substances, upon which electricity would act.

1630—Nicholas Caboens, at Ferrara, repeated the experiments made by Gilbert, and made some progress in adding to the list of electrics.

1670—Mr. Boyle made some discoveries which escaped the notice of his predecessors.

Otto Guericke, of Magdeburg, (inventor of the air-pump,) made some advances, and was the first to discover, that a body once attracted by an excited electric, was repelled by it, and not again attracted, until it had touched some other body.

Dr. Wall, about the same time, observed light and sound produced by rubbing pieces of amber with wool, and experienced a light shock.

1675—Sir Isaac Newton gave to the Royal Society an account of similar experiments made by him.

1709—Mr. Hauksbee distinguished himself by discoveries in electrical attraction, and repulsion of electric light. After his death, little was done for twenty years.

1728—Mr. Stephen Grey, a pensioner at the Charter House, and his friend, Mr. Wheeler, made a great variety of experiments, and discovered that electricity might be communicated from one body to another, even without those bodies being in contact.

1733—Du Fay, of France, repeated the experiments of Mr. Grey; but added little or nothing of his own.

1734—Mr. Grey made experiments upon iron rods, from whence came the term "metallic conductors."

1739—Dr. Desaguliers made several experiments.

1742—Mr. Boze, Professor at Wittenburg, and other Germans, made experiments. Mr. Winckler used a cushion, instead of the hand, to excite the globe. Mr. P. Gordon, a Benedictine monk, and professor of philosophy at Erford, was the first to use the cylinder, instead of the globe. With his machine, he conveyed the fluid along wires 200 ells in length, and killed birds. Dr. Ludolf, of Berlin, in 1744, made some experiments. Mr. Boze fired gunpowder by electricity. Mr. Gordon made the electric star. Mr. Winckler, by the agency of electricity, made a wheel to move.

1745—Mr. Collingson sent to Philadelphia an account with these experiments, with a tube, and directions how to use it.

Franklin, with some of his friends, immediately engaged in a course of experiments, the results of which are well known. He was enabled to make a number of important discoveries—proposing theories, accounting for various phenomena, which have been universally adopted, and bid fair to endure for ages.

Several experiments were made in Holland and Germany.

Dr. Miles, of England, fired phosphorus by the application of the excited tube itself, without the intervention of a conductor.

Dr. Watson fired air, made inflammable by a chemical process, and discharged a musket by the electric fluid. He made many other experiments.

Mr. Cuneus, of Leyden, made the discovery of the famous "Leyden phial;" and Mr. Von Kleist, dean of the cathedral of Camin, is said to have discovered it about the same time. By this discovery, electricity could be accumulated, and severe shocks given.

1746—M. Gralath gave a shock to 20 persons at once, and at a considerable distance from the machine. He constructed the electrical battery, by charging several phials at once. Mr. Winckler and Mr. Monnier, in France, transmitted the electric fluid through several feet of water, as a part of the circuit.

Mr. Nollet, in France, killed birds and fish by the discharge of the Leyden jars. Improvements were made by Dr. Watson and others in the Leyden phial, by coating the inside and outside of it with tin foil. The Abbe Nollet gave a shock to 180 of the guards, in the king's presence, and to the whole community of the grand convent of the Carthusians, in Paris, by means of wires between them, forming a line of 3,600 feet in length. The same experiment was tried in France, through a circuit of persons holding wires between them for 2½ miles. In another experiment, the water in the basin of the Tuilleries was made a part of the circuit.

Mr. Monnier, the younger, to discover the velocity of electricity, discharged the Leyden phial through an iron wire 4,000 feet in length, and another of 1,319 feet; but could not discover the time required for its passage.

1747—Franklin communicated his observations, in a series of letters, to his friend Collinson, and explained in a satisfactory manner the phenomena of the Leyden phial.

Dr. Watson, and others, conveyed the electric fluid across the Thames at Westminster bridge, making the width of the river a part of the circuit. He proved, that the ground also conducted the fluid, by an experiment with a wire 150 feet long, supported upon baked sticks, using the ground as half of the circuit. In another experiment, he made the dry ground a part of the circuit for a mile, and found it to conduct equally as well as water. The transmission of the electric fluid was instantaneous.

Mr. Ellicott constructed an electrometer for measuring the quantity of electricity; and Mr. Maimbury, of Edinburgh, electrified two myrtle trees in the month of October, and they put forth small branches and blossoms sooner than those which had not been electrified. The same experiment was tried upon seeds sown in garden pots, with the same success. Mr. Jallibert, Mr. Boze, and the Abbe Menon, at Angers, tried the same experiment upon plants, by electrifying bottles in which they were growing. They proved that electrified plants always grew faster, and had finer stems, leaves, and flowers, than those which were not electrified.

1748—Franklin and his friends held an *electrical feast* on the banks of the Schuylkill, near Philadelphia, which was amusing as well as scientific. He gives an account of it to his friend Collinson in these words:—"Chagrined a little, that we have hitherto been able to produce nothing in this way of use to mankind; and the hot weather coming on, when electrical experiments are not so agreeable, it is proposed to put an end to them for this season—somewhat humorously, in a party of pleasure, on the banks of the Schuylkill. Spirits, at

the same time, are to be fired by a spark sent from side to side through the river, without any other conductor than the water; an experiment which we some time since performed, to the amazement of many. A turkey is to be killed for our dinner by the *electric shock*, and roasted by the *electrical jack*, before a fire kindled by the *electrified bottle*; when the healths of all the famous electricians of England, Holland, France, and Germany, are to be drunk in *electrified bumpers*, under a discharge of guns from the *electrical battery*."

1749—Franklin first suggested his idea of explaining the phenomena of thunder gusts, and of the *aurora borealis*, upon electrical principles; and in

1752—He completed his grand discovery, by experiments. He constructed rods, and brought the lightning into his house to ascertain if it were of the positive or negative kind. He succeeded in the experiment for the first time in April, 1753; when it appeared, that the electricity was negative. On the 6th of June, he met with a cloud electrified positively. His discoveries roused the attention of all Europe, and many distinguished electricians repeated them with success.

Towards the end of the 18th century, the science was extended by numerous and useful experiments.

1787—Mr. Lomond, of France, invented the first electric telegraph of which we have any account. He communicated with a person in a neighboring chamber, by means of electricity; but it does not appear that it was used on extended lines.

1794—Reizen made use of the electric spark for telegraphic purposes, but never tested to any extent.

1798—Dr. Salva, of Madrid, made a similar telegraph to that of Reizen. No description of his plans have been seen, and probably were never given to the public.

Galvani, in 1790, and Volta, in 1800, made, as is well known, many important discoveries.

1809—Samuel Thomas Soemmering invented his voltaic electric telegraph.

1816—Bonald invented an electrical telegraph, and tried it at his house, Hamersmith.

1832—Professor Morse was the inventor of the electro magnetic telegraph, and the first really practicable telegraph on the electric principle. All the telegraphs in Europe are invented subsequently.

1833—The Baron Schilling, of Russia, constructed an electric telegraph, which was received with approbation by the emperor, who desired it established on a larger scale; but the death of the baron prevented it.

Counsellor Gauss and Professor William Weber constructed one.

1836—Taquin and Ettieyhausen made experiments with a telegraphic line over two streets in Vienna.

1837—Alfred Vail invented an electro magnetic printing telegraph.

Wheatstone made an electric needle telegraph.

Steinhilf, (Dr.) of Munich, erected between that city and Bogenhausen, a magneto electric telegraph. In the account he gives of his own telegraph, he says, that Belancourt established, in 1798, a communication from Madrid to Aranjuez, (26 miles,) by means of a wire, through which a Leyden jar used to be discharged, which was intended to be used as a telegraphic signal.

Maçon, professor of philosophy, at Caen, (France,) made trial of an electric needle telegraph, at the college of that city, for a distance of about 600 yards. He has since endeavored to simplify and improve his apparatus.

1837—Davy's needle and lamp telegraph.

1838—Mr. Amyot proposed in Paris to construct an electric telegraph.

Edward Davy—electric telegraph.

1840—Alexander Bain—electric printing telegraph.

1841—Wheatstone's rotating disc telegraph.

All the telegraphs—from Morse to Wheatstone—have several wires and needles; but the latest invention of House, with Jacob Brett's improvement, is indisputably the best of any yet discovered, and is the very perfection of a really printing telegraph, which, with one wire, conveys the letters themselves; and has also this immense advantage over all others—as the communication can be made without the intervention of a third person—that is to say, the parties themselves can carry on their own correspondence.

#### Lehigh Navigation Company.

We continue in this number of the Journal, the report of the managers of this company—giving their exhibit of its condition.

#### Summary of the Interest Account of the Lehigh Coal and Navigation Company, for the year 1846.

To charges to interest incidental to current business.....	\$10,592 98
To interest on judgments obtained prior to the general mortgage.....	3,008 20
To interest on mortgage loan, carried to the credit of the accounts of individuals taking coal.....	52,901 76
To common loan interest prior to Oct. 1, 1842, for which, under agreement, certificates of mortgage loan were issued.....	1,314 09
To purchase of common loan interest, convertible into cash if required..	58,935 23
To interest set off by certain holders of common loan against ground and water rents due by them to the company. The legal right of set off in these cases being sustained by opinion of company's counsel, the said interest claims were allowed in settlement of said rents.....	1,084 10
To interest account for 1847, for balance of interest due and unpaid, December 31, 1846, carried to account for ensuing year, viz:	
Arrears of int. on mortgage loan.....	\$12,009 67
Arrears of int. on common loan.....	891,198 04

903,207 71

\$1,031,044 07

By interest of account of 1845, for balance of interest unpaid December 31, 1845.....	\$757,161 57
By interest received in 1846.....	3,278 89
By balance carried to profit and loss account, January 1, 1847.....	270,603 61

\$1,031,004 07

### Profit and Loss Account of the Lehigh Coal and Navigation Company, for the year 1846.

Balance against profit and loss, January 1, 1847.....	\$37,976 83
Interest account for the year 1846.....	\$270,603 61
Repairs of Lehigh and Susquehanna railroad.....	4,237 18
Repairs of navigation.....	68,981 94
	343,872 73
Balance carried down to the credit of profit and loss, January 1, 1847.....	106,154 53
	\$488,004 09
Discount on debt extinguished.....	\$33,009 44
Ground rents, water rents, etc.....	24,191 17
Net profit on coal sold in 1846.....	198,131 88
Net tolls for 1846.....	232,671 60

\$488,044 09

Balance brought down to the credit of profit and loss, January 1, 1847..... \$106,154 53

The following exhibits a comparative view of the profits in 1843, 1844, 1845, and 1846, on the items of coal and tolls, and the amount of interest which fell due in each of those years:—

ON COAL AND TOLLS.			
1843.	1844.	1845.	1846.
218,498 51	289,711 45	337,939 70	430,803 48
INTEREST.			
304,608 94	298,197 85	278,923 47	270,603 61

### Summary for 1846.

Profits.....	\$488,004 09
Interest and repairs.....	343,872 73

Excess over interest and repairs..... \$144,131 36

Being an improvement, compared with the result of 1845, of \$88,646 51.

### Comparative Indebtedness of the Lehigh Coal and Navigation Company, January 1, 1846, and January 1, 1847.

	Jan. 1, 1846.	Jan. 1, 1847.	Increase.	Decrease.
Mortgage loan.....	\$921,760 69	\$923,074 76	\$1,314 09	
Common loans.....	3,722,721 01	3,688,922 16		33,798 85
Floating debt.....	4,614,481 78	4,611,996 94		32,484 84
Total.....	4,954,463 84	4,852,971 91		69,001 00
Arrears of interest, viz:				
On common loan.....	737,525 95	891,198 04	153,672 09	
On mortgage loan.....	19,635 62	12,009 67		7,625 95
Total.....	757,161 57	903,207 71	146,046 14	
Unpaid dividends.....	798 70	798 70		
Loans SUMMARY.				
Floating debt.....	4,614,481 78	4,611,996 94		32,484 84
Arrears of interest.....	309,976 06	540,974 97		69,001 09
Unpaid dividends.....	798 70	798 70		
Total.....	\$5,712,418 11	\$5,756,978 32		

The increase of \$1,314 09, in the mortgage loan above mentioned, arises from issues of said loan for that amount of interest, which accrued prior to October 1, 1842, on common loan.

The decrease of \$33,798 93, in the common loan above mentioned, is caused by the payment of the remaining judgments obtained on certificates of said loan prior to the execution of the general mortgage, 7th March, 1842.

NOTE.—The only loan of the company convertible into capital stock, is a portion, viz: \$196,509 39, of the mortgage loan.

### Summary of the Liabilities and Assets of the Lehigh Coal and Navigation Company—Jan. 1, 1841, to Jan. 1, 1847.

	Jan. 1, 1841.	Jan. 1, 1842.	Jan. 1, 1843.	Jan. 1, 1844.	Jan. 1, 1845.	Jan. 1, 1846.	Jan. 1, 1847.
<b>LIABILITIES.</b>							
Capital stock.....	\$1,503,550 00	\$1,503,550 00	\$1,503,550 00	\$1,503,550 00	\$1,503,550 00	\$1,503,550 00	\$1,503,550 00

\* A week after this date, viz., on the 8th of January, 1841, occurred the memorable and destructive flood in the Lehigh.

### STOCKHOLDER'S MEETING.

At the stated annual meeting of the stockholders of the LEHIGH COAL AND NAVIGATION COMPANY, held May 4th, 1847, THOMAS P. COPE, Chairman:

The Board of managers submitted a report and other documents, detailing the transactions of the year 1846, and exhibiting the condition of the company's affairs at the close of that year, and the same having been read, the following resolution was adopted, viz:

*Resolved*, That the report and accompanying documents just read, be approved, and that the Board of managers be requested to publish such portions thereof, as may be deemed expedient.

The following resolution was also adopted, viz:

*Resolved*, That this meeting hereby expresses its decided approval of the management of the affairs of the company, during the past year.

THOMAS P. COPE, Chairman.  
EDWIN WALTER, Secretary.

*Improved Method of Tempering Tools.*—Mr. Alfred V. Newton, of the Patent Office, Chancery Lane, has taken out a patent (being a communication) for an apparatus for hardening and tempering edge tools. For heating axes or other similar articles, a heating furnace is constructed in the form of a vertical cylinder, the exterior made of sheet iron lined with fire brick 4 ft. 8 in. diameter, or of such outside diameter as to give it an inside one of 4 ft. and 3 ft. high. In the interior of this cylinder, several fire chambers are formed, usually four; the inner wall of each fire chamber is 18 in. long, 4 in. from front to back, and about 4 in. in depth, forming, in the whole, a circle of 3 ft. 4 in. diameter; under each there are grate bars, and air is supplied through a pipe, connected with a blowing apparatus. A circular table of cast iron, 3 ft. 4 in. diameter, is made to revolve slowly on a level with the upper part of the said chambers; this table is sustained on a central shaft, which passes down through the furnace, and has its bearing in a step below it; a pulley keyed on to it serves to communicate rotary motion to the table. When the axes or other articles are to be heated, they are placed upon the table with their bits or steeled parts projecting so far over its edge as to bring them directly over the centre of the fire, and the table is kept slowly revolving during the whole time of heating. When duly heated, they are ready for the process of hardening. The hardening bath consists of a circular vat of salt water; within the tub or vat, a little above the surface of the liquid, is a wheel mounted horizontally, with a number of hooks around the periphery, upon which the axes or other articles are suspended; the height of the hooks from the surface of the liquid is such as to allow the steeled part only to be immersed; as soon as the hardening is effected, the articles are removed from the hooks, and cooled by dipping in cold water. With the best cast steel, a temperature of 510° Fahr. has been found to produce a good result in hardening in about 45 minutes.

## LOCOMOTIVE ENGINES.

The following description, and illustration, of "*Galloway's Improvements in Locomotive Engines*," was prepared for the first number for June of the Railroad Journal; but while the illustrations were in the hands of the engraver, the copy was mislaid, and thus the article has been delayed.

The mode of obtaining adhesion is so different from any now in use, that it may be well for it to be understood.

We find in the same number of the Civil Engineer and Architects Journal, a description, with illustrations, of Stephenson & Howe's three cylinder engine, which we shall endeavor to give in a subsequent number.

Fig. 1.

Fig. 2.

Fig. 3.

*Elijah Galloway, of Buckingham street, Strnd, Middlesex, engineer, for "Improvements in Locomotive Engines."—Granted April 18; Enrolled October 18, 1846.*

In constructing locomotive engines for railways, it has heretofore been usual to give motion to two or more of the wheels which carry the engine and it has been proposed to apply a central rail to a railway and to employ rollers on either side, pressed towards each other by a hand lever, and motion was communicated to one of them from the axis of two of the carrying wheels. Now one of the objects of this invention is no longer to use the carrying wheels as driving wheels. Another object of this invention is to apply the power employed to both of two wheels placed on either side of a central rail, and to obtain the requisite holding or bite on the central rail by causing such two driving wheels to be pressed towards each other, and consequently against the rail, by means of springs and apparatus suitably arranged for causing the two driving wheels (on each side of the central rail) to press the rail more or less, according as more or less holding to the rail is required from time to time.

The driving wheels of the locomotive engine, shown in the engraving, are applied horizontally on each side of a centre or middle rail, and are pressed towards each other by means of springs, the pressure of which can be regulated by adjusting screws, or by any other convenient means, so that they may be pressed towards each other with any degree of force the springs will admit of. The pressure, therefore, of these wheels is exerted simultaneously on each side of the middle rail. By such an arrangement it will be evident that the bite or adhesion necessary to propel the train is independent of the weight of the engine, and as the adhesion can be increased or diminished exactly according to the amount of force with which the driving wheels are pressed against the rail, this system obviates the slipping of the driving or propelling wheels upon the rail, heretofore consequent on making the driving wheels also carrying wheels in a locomotive engine.

Fig. 1, is a side elevation, and Fig. 2, a cross section of a locomotive engine, and Fig. 3, is a plan, with boiler and such parts omitted as would interfere with the view of the same. *a, a*, are the driving wheels worked by cranked axles. Each wheel is worked by a pair of cylinders, the one above the other, the pistons of which operate on the axis in much the same way as the engines of the present locomotive. The slide valves may be at either side of the cylinders, and worked by eccentrics placed on the axes. To secure the necessary bite on each side of the middle rail, the lower bearings of the axes are at

liberty to move for a limited distance horizontally, in mortices or slots for that purpose in the horizontal frame, *b, b*; these bearings are pressed towards each other by the springs *c, c*. To effect the desired adjustment of the pressure of the springs, the rods are connected to the centre pieces, *e, e*, one of which has a right and the other a left handed female screw through it, the threads of which fit the right and left handed screws on the rod, *f, f*. On one end of *f, f*, there is a bevel wheel *g*, working into another bevel wheel *h*, the axis of which is carried up in front of the fire box, as seen dotted in Fig. 3, and has a handle accessible to the engineer, so that the pressure of the springs on the driving axes, and consequently the bite of the driving wheels on the middle rail, can be adjusted at pleasure when the engine is in motion.

The claim is for the mode of giving motion to locomotive engines, whereby two actuated wheels, *a, a*, are used; and the causing of two wheels to be pressed towards each other and to a central rail.

**NOTICE TO CONTRACTORS.—ANDROS COGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Railroad Office, in Lewiston, until the 17th of August next, inclusive, for the Grading and Masonry of the 2d Division of this Road, extending from Green to Belgrade, near Snow's Pond, about 20 miles.

Profiles will be ready for examination on and after the 10th of August, and all necessary information will be given, either at this office, or upon application to the resident engineers on the line of the road.

Satisfactory bonds with sureties shall be given by the bidders, if required.

On the 16th of August, the Engineer will be prepared to accompany Contractors over the line of the road, commencing at the eastern end of the Division in Belgrade.

HOBART CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office, Lewiston,  
July 13, 1847. }

3:31

**ATLANTIC AND ST. LAWRENCE RAILROAD.**—Notice to Contractors.—Proposals in writing will be received at the office of the Atlantic and St. Lawrence Railroad Company, in the city of Portland, until Tuesday, the tenth day of August next, inclusive, at sunset, for the grading, masonry, and bridging of that portion of their road extending from the termination of the second division near the hotel road in Danville, to a place in the vicinity of Norway and Paris cape, a distance of about 30 miles.

Maps, profiles, and specifications will be ready for examination on and after the second day of August next, at the Engineer's office in Portland, where all necessary information will be given.

The company will require, as one of the stipulations of the contract, that the heavier work on any section, shall be first attended to, so that the heavier and lighter work may be completed at nearly the same time.

Persons unknown to the officers of the company must accompany their bids with satisfactory evidence of their ability to execute the work. In all cases good and sufficient bonds with two or more sureties will be required for the faithful performance and fulfilment of the contract.

WM. P. PREBLE, President.

Portland, June 30, 1847.

3:38

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advancements on consignments to their address.

July 31—3m

ROBERT GRACIE.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 12 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz:  
180 tons 24 x 1 inch Flat Punched Rails, 20 ft. long.  
25 " 24 x 1 " Flange Iron Rails.  
75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**THE SUBSCRIBERS ARE PREPARED TO**  
execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by  
JOHN A. ROEBLING, Civil Engineer,  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrestor recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.  
Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriitt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston.

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10f

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trelis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trelis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trelis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,324 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33f

### LAP—WELDED WROUGHT IRON TUBES

FOR

### TUBULAR BOILERS,

FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

28 Platt street, New York.

### RAILROAD IRON.

#### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address **J. M. HOWE,**

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniatta Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**

12f

Vine St. Wharf, Philadelphia.

#### RAILROAD IRON.—THE "MONTOUR

Iron Company," Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

**MURDOCK, LEAVITT & CO.,**

Agents.

1y48

77 Pine St., New York.

#### LAWRENCE'S ROSENDALE HYDRA-

lic Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by **JOHN W. LAWRENCE,**

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**

75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.			Weight per fathom.	Diameter of iron.	
	INCH.	LBS.	OZ.	INCH.	LBS.	OZ.		LBS.	INCH.	
11	4½	13	5	10	24	-		50	15-16	20
13	3½	9	3	8½	16	-		27	11-16	13½

16	2½	4	3	6	8	4		10½	7-16	7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

**DAVIS, BROOKS & CO.,**

Jan. 2.

[1tf]

68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

**WILLIAM ROE, Sup't of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] **G. A. NICOLL,**

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck has been in use on the Long Island railroad for the last year, under a freight car. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**

Jersey City, November 4, 1845.

**N. Jersey Railroad and Transp. Co.**

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,  
Jamaica November 12, 1845.

[Signed,] **JOHN LEACH,**

1y19 Sup' Motive Power

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for

some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
ja45 Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**  
ja45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents,**

No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10lf

**RAILWAY IRON.—DAVIS, BROOKS & Co.,** No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 46lf

## NORRIS' LOCOMOTIVE WORKS.

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS, 48** State st., or to **CURTIS, LEAVENS & CO., 106** State st., Boston, or to **A. & G. RALSTON & Co.,** Philadelphia. ja45

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,** Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 11f

**PATENT INDESTRUCTIBLE WATER**

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28f

J. BALL &amp; CO.

**CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.** On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent.**

**LITTLE MIAMI RAILROAD.—OPEN**  
TO SPRINGFIELD—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows.

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freepport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	.....\$1 00
" " " Xenia	.....1 50
" " " Springfield	.....2 00
" " " Columbus	.....4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 11 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47th W. H. CLEMENT, Sup't.

**PATERSON RAILROAD**  
Summer Arrangement.

Commencing April 20th, 1847, the cars will leave

Paterson at	New York at
8 o'clock a.m.	9 1/2 o'clock a.m.
11 1/2 o'clock a.m.	12 1/4 o'clock p.m.
4 o'clock p.m.	5 1/2 o'clock p.m.

On molasses and oil.....\$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**  
Passenger Train runs daily from Charleston,

on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50  
Fare through from Charleston to Huntsville, Decatur and Tuscumbia.....22 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

THE WESTERN AND ATLANTIC Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAILROAD**  
line—direct. Via Newark, New Brunswick, Princeton, Trenton,

and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4 1/2 " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1/2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3 1/2 and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25th

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, August 14, 1847.

### Kennebec and Portland Railroad. Proposals to Contractors.

It is quite cheering to receive these notices so frequently—and from different sections of the country, also. It shows that the right spirit is abroad, and that the next five years will add immensely to the extent of American railroads.

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.** Proposals will be received at this office, and at the office of the Resident Engineer, in Gardiner, until the 21st of August, for the Grading and Masonry of 21 miles of this road, extending from Bowdoinham to Augusta.

The line of road and the place and profiles will be ready for examination on the 12th of August, after which time any information in relation to the work can be had at the engineer's office in Brunswick and Gardiner, or of the resident engineer on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to complete the work.

The remainder of the line from North Yarmouth to the depot of the Portland, Saco and Portsmouth Railroad in Portland, 15 miles, will be ready for contract on the 18th of September, at which due notice will be given. **GEORGE S. GREENE,**

Engineer K. & P. R. R.

ENGINEER'S OFFICE, K. & P. R. R.  
Brunswick, July, 12, 1847. } 233

### Railroad to Cambridge.

A meeting was held at Cambridge on Thursday evening, on the subject of a branch railroad from the Fitchburg road (at the Lowell crossing,) through the city of Cambridge to the Worcester road—thus to connect the Worcester, Lowell, Maine, and Fitchburg roads. The Mayor presided and addressed the meeting, as did also Hon. Isaac Livermore. A committee was appointed to procure a survey, and

to confer with the Grand Junction railroad company. The meeting was adjourned to the first Thursday in September.

Thus will it be throughout all New England. Cross roads and branch roads will connect, and intersect, the main lines, until every town of any considerable importance has its railway facilities.

### Georgia Railroad and Banking Co.

We have received the following correction of an error, and give it a place of course. It was from the fact that the dividend alluded to was so much larger than the preceding ones, that we supposed it to be an error of the printer—but we are pleased to learn that it was correct. The writer says:

"In No. 30 of your Journal—in a note appended to the statement of dividends declared on the stock of the Georgia Railroad and Banking Company—you say, in reference to dividend No. 9, \$220,161 20. 'This is evidently an error.' There is no error, the dividend being *ten per cent.* on a capital stock of \$2,201,612. Please correct.

"You will see a statement of the *No. of Cars* belonging to the company in the first part of Engineer's Report. Would it not be well for you to make a requisition for the number of *locomotives* owned by each railroad company in the United States, as well as the number of cars, and add a column for each to your 'Table of Railroads'?"

In accordance with the suggestion of the writer, Mr. F. C. Arms, Superintendent of the Georgia road, we now call upon all the railroad companies for a statement of the number of cars and locomotives owned by each—and promise, if we receive them, to add them to our next edition of the Table of Railroads.

### Telegraph System.

To the Editor of the Railroad Journal:

Sir: Mr. Amos Kendall states, in an article published in your Journal of 12th June last, that "you are in error where you say that some two or three, or a small number of individuals, of whom Mr. Kendall is a copartner and agent, owning under this system *one-half* the stock, have the absolute control of all the telegraphs in the United States, with the power of taxing, to any extent, the transmission of intelligence, however imperfectly the duty may be performed."

In regard to the first part, the writer of this knows that Mr. Kendall has exercised *absolute control* of the line between Washington city and New York, by

his voting the stock held by himself and the patentees, against a majority of that represented by the stockholders who furnished the means to construct the line; although he says in the article above referred to, that they "cheerfully yield the management to the other stockholders." He further says that "the preponderance in the company, (that is the New York and Washington company) which has honored him with its presidency, has been largely augmented by the sale of one-fourth of the patentees' stock, and their power now, in the vote of that company, is but as seven to twenty, and no more." Now it is well known that at the meeting of the above company, held in this city during July last, for the purpose of electing officers, that Mr. Amos Kendall voted 522 shares of 1096 shares of the stock voted; of this amount nearly 300 shares are held by Mr. Kendall, the agent of the patentees, and which is nearly *one-third* of the stock voted at that meeting; besides this, he voted by proxy all the stock belonging to Professors Morse & Gale, and Mr. Vail, who are interested in the patent right.—You will therefore perceive, that Mr. Kendall voted in his own name, and in behalf of the patentees, nearly *one-half* of the whole stock voted at the last meeting of the Magnetic Telegraph Company.

This alone was enough to elect his candidate, Mr. French, by a majority of 155 votes over the stockholders' candidate, Mr. Hart.

The stock voted by the New York and Washington stockholders for Mr. French, amounted to 207 votes, and if Mr. Kendall had left it with the stockholders, and "yielded the management to them," their candidate, Mr. Hart, would have been elected by a majority of 160 votes.

This proves that no dependence can be placed in Mr. Kendall's statement, and that they do not "yield the management to the stockholders" who furnished them with means to build the first line of telegraph ever constructed in this country by private enterprise.

A line is now in course of construction between Washington city and New Orleans; and a writer in the Charleston Mercury cautions persons against investing their money in it, as the patentees receive half the stock of that company, and therefore have the control and management of its affairs. He also states that the election of officers, etc., would be in the hands of the patentees, (who do not furnish the means) and therefore they would be at the mercy of the owners of Morse's patent.

The proceedings in this city, and the ground taken by Mr. Kendall, conclusively prove, that you were correct in your statements, although Mr. Kendall denies that they would ever exercise such power. Subscribers have also urged this as an objection to taking the stock.

It is hoped that the stockholders south will profit by the experience of the stockholders of the New York and Washington line of telegraph; and act with a view of restricting Mr. Kendall's monopolizing propensities.

#### A STOCKHOLDER.

We give place to the preceding communication, from "A Stockholder," for the purpose of eliciting from Mr. Kendall an explanation of the course pursued by him at the late election in this city, for officers of the New York and Washington Telegraph Company.

In our remarks on this subject, in the Journal of the 10th April, we took the ground that a few men—and those *not* the ones who furnished the capital to put up the different lines—would have the *entire* control of the system; and objected to the present plan of management on that account. In reply to these remarks we published, on the 12th June, Mr. Kendall's letter, denying the statements made by us. He says in reply, that "you (we) are equally in error when you say that it has become a monopoly of the closest kind, and threatens to be one of monstrous character," etc.; and he further says that "no stockholder, under the articles of association, can give over *one-sixth* of the aggregate vote. This restriction reduces the power of the patentees far below one-half—even where they hold one-half the stock—and gives the other stockholders a preponderance equal to *sixteen against four*." Yet, with all this preponderance, we see the apprehensions expressed by us on 10th April verified at the first election following, which took place in July.

We have heard of the unexpected result of that election—and of the means by which that result was brought about; but did not choose to speak of it until we had the authority of some one who knew, and was responsible for what he might say—and having such authority for the preceding, we do not hesitate to give it a place, and again to express our belief that the present system of management will never be satisfactory to the people of this country, and that rival lines will be established.

A Railroad Spark Conductor has been introduced by Dr. Flagg, of Boston—a funnel attached to the locomotive chimney, so connected with tubes along the train as to conduct smoke and sparks to the rear.

#### Nashville and Chattanooga Railroad.

We find the following letter, from V. K. STEVENSON, Esq., of Nashville, in the Charleston Mercury, of 4th inst. The writer appreciates fully the importance of early and vigorous efforts in favor of this important work—and he holds up to view *some* of the more prominent advantages which are sure to result from the construction of a railroad from Nashville to connect with the Georgia railroads—thus opening, on its completion, two avenues to tide water, viz: Charleston and Savannah—and at no distant day at two other points, viz: *Apalachicola* and *Mobile*; thus giving to the people of Tennessee, Kentucky, Ohio, Indiana and Illinois, a direct, easy and cheap communication with the interior, and outlets of these four southern States. It is indeed difficult for any person, who has not thoroughly studied the subject, to appreciate it justly. This link in the chain—or rather thread in the web, when

extended to Louisville, or the Ohio river, as it surely will be—will be found more important than any other *one* of the numerous works in the connection, for the reason that it will be the *connecting link* between the two extremes, which may be said to form, each by itself, a complete system of railroads. It will enable the southern *Atlantic*, and the northern *Lake States*, to communicate directly with each other, instead of the present circuitous route by *New York*, or *New Orleans*. By this route it can be done in fewer *hours* than it now requires *days*!

We give the letter of Mr. S., and express the hope that the people of Charleston and Savannah, of Macon and Augusta, and indeed of South Carolina and Georgia, will meet the question with enlightened views and liberal hands. The editor of the *Mercury* takes the right view of the matter, and says:

"We have been favored for publication with the letter which appears below; and to the importance of the enterprise of which it speaks, we invite particular attention. Now that the Western and Atlantic road has reached Dalton, and is in progress of completion to its terminus at Chattanooga, it is time that Georgia and South Carolina should awaken to the means necessary to extend it to Nashville; and from thence, as proposed, to Louisville and Cairo, at the junction of the Mississippi and Ohio. These States are equally interested; and surely the Central and the Macon and Western, the Georgia and South Carolina railroads, with the cities of Savannah, Macon, Augusta and Charleston, may make up the deficiency of subscription mentioned in the letter from Nashville. That city, with a population not exceeding 10,000 inhabitants, has set a noble example to her sister cities of Savannah and Charleston on the Atlantic; and we are pleased to see the suggestion in our papers that contributions to railroads be made a test question at our next elections."

NASHVILLE, TENN., July 25, 1847.

DEAR SIR: Since receiving your highly esteemed letter of 22d June, our city corporation have agreed to become stockholders to the amount of half a million of dollars in the Nashville and Chattanooga railroad company, to this we have about sixty thousand dollars of private subscribers. Our board of commissioners have since met and appointed Gov. Jones and myself agents to procure subscriptions, and we will commence on the 6th of August, I think, with good prospects to get a million more in Tennessee from private subscribers. This will require an immense effort, and if we should be successful we think we will have given you sufficient evidence of our earnestness and faith, and we hope then to be able to call on South Carolina, where the next greatest interest lies, with certainty of aid in the way of a subscription from her and Georgia to the amount of three millions of dollars. I hope and feel that we will not be disappointed; if so, or I thought so; I for one would lay down my books and quit the work, for we cannot get more than the million and a half, and I would not be willing to strike a lick upon the road with less stock taken than two and a half millions.—Please give your opinion upon this subject, for we are working in the dark.

Louisville has obtained a railroad charter, as I am told, to the Tennessee line; and wish so soon as we start to get Tennessee to give them a charter to Nashville, so as to reach your market with their immense products.—

Cincinnati is also anxious to build the road to Louisville. Evansville, Indiana, pressing forward to get a charter to cross western Kentucky to Nashville with a railroad also to get to your market. In fact, the whole west is looking to connections at Nashville to get the advantages of the southern market and seaports. The president of the Cairo company, now renewed and in wealthy hands, addressed me a long letter a few days since, regarding the Central railroad from Cairo to Springfield, Illinois, there to connect with the Cincinnati and St. Louis railroad, and thence across the same to Galena, the heart of the great mining country; thus the Nashville and Chattanooga railroad he thinks will be of great advantage to the Central railroad of Illinois and to the city of Cairo. The goods brought from New York for the great valley he thinks will all come this way for all points below Louisville, Kentucky, and be distributed for the lower valley at Cairo, and sent from Illinois by the Central railroad from Cairo.

Our coal fields, reaching from below Chattanooga to a point 85 miles from Nashville, will be a source of great profit to the road, and to your Georgia and South Carolina roads; for at the rate charged for carriage by the Baltimore and Ohio railroad, coal can be taken to Charleston much cheaper than you are now paying for the same quality of coal, and to Nashville for little over one-third of what we are now paying for it. I understand that there are gradients of 80 feet to the mile on the Baltimore and Ohio road, too, which is heavier than any on these roads. Iron also abounds in the vicinity of our road, and in the same hills with the coal. The finest varieties of marble also is to be had in any quantity on the line of the road. The coal hangs over the road at different points in passing down the Tennessee river, and up Crow creek for 60 miles.

I shall be pleased to hear from you upon this important subject. Truly,

V. K. STEVENSON.

Col. JAMES GADSDEN, Charleston, S. C.

We shall publish, at an early day, a well written article, from the *Augusta Chronicle*, signed "Georgia," which gives many important and interesting facts in relation to the country around Chattanooga, and of its business, and business facilities, which ought to be more generally known and appreciated.

#### Interest on Instalments.

The question has been often asked us "how can a railroad company pay interest on instalments, before the road is completed." The "*how*" was never very difficult for us to understand, any more than for an individual to pay interest on a loan of capital to carry on any manufacturing or commercial business—yet we may not have been able to explain the matter to inquirers as clearly as we find it done to our hand in "*Heraclitus's Railway Journal* of 29th of May last—from which we make the following extracts, viz:

The editor says "one of the questions to be brought before them is the paying of interest on calls. It has been recommended by some of the wise heads of the House that this should be abolished. Now, though no immediate connexion appears between the paying of interest and the success of the new lines, it is really and truly the marrow of

their existence and success, and the chairmen who form part of the chancellor's committee, know it. We will take, for our example, the London and York. It is well known that the shares of this line are spread out to an almost indefinite extent. They are not in large, but small holdings—the very best holdings that a line can have. We have heard of there being as many as 10,000 shareholders in this line. Most of these people have taken the shares on the belief that they will form a good and profitable investment, and as by the act 5 per cent. interest is allowed, they have in large numbers withdrawn their all from the funds and other securities, and paid up in full in the London and York. It is difficult to say to what extent their prepayments are made, but we have heard, to some hundreds of thousands already. Deprive these people of their interest, and what do you do, but reduce them to beggary, or oblige them to sell at a ruinous loss? Upon the faith of the act of Parliament, they invested their money, and should that now be interfered with? Upon no principle of honor or honesty can it be."

Again he says "Let us take a case mentioned to us the other day. A person, a lady if you please, for in this our gallant country, ladies' cases always command a preference, suppose has £2,000, which at 5 per cent. would bring her in £100 per annum. She is advised that a certain railway will be a good investment, but it pays no interest, and will take four years in making, while there is another equally good that will pay 5 per cent. during construction, and like the other, will yield the limited ten per cent. afterwards, can there be any doubt which she will take? She sees immediately that the former, as she must live and eat during the time of construction, will reduce her capital from £2,000 to £1,800, supposing the calls made uniformly, and of course she rejects it; but, in the other she says, "Oh! it is a good concern, I'll then have the whole of my money at once, to save fluctuations in the funds, and the trouble of attending to the calls." She does. Others do the same, and instead of four years, the line is made in three, and made at least ten per cent. cheaper, because the funds are in hand. So, in fact, the whole £300 interest paid out to the lady, is saved, and she gets her ten per cent. dividend one year earlier. But we will give "the sum total of the whole" in figures, for Mr. Joseph Hume's benefit, as we believe he professed to be horrified at the interest-paying affair.

"If the money is paid in advance, the company can get, at any time, one per cent. from the bankers less than the usual rate of interest; but, let us suppose it is two per cent. less. Then the account stands thus:

Advanced .....	£2,000
Deduct interest at five for three years .....	£300
Less interest at three per cent. for half the time .....	90
	210

Cost of the works .....

"On the other hand, if no interest is allowed, the calls will be badly paid; money will be short; the line will take at least a year longer to make, and for want of the needful will cost, as before observed, ten per cent. more. Then it will be thus:

Calls paid .....	£2,000
Ten per cent. extra cost .....	900
Loss of interest for half the time, or 3 years .....	150

Total amount to shareholder .....

"So that here is £140 on the cost of construction in favor of the interest system. But, besides that, the lady, at the end of the four years, has received one year's dividend, or ten per cent., while the other has received none. Deducting half for the interest,—that makes £100 more. Add this to the £140; and at the end of four years the lady is no less than £240 better off than the no interest line, besides £140 capital being saved to the public, which, at ten per cent., will be £14 a year in the pockets of the public in reduction of fares, and not a sixpence detriment to the shareholder.

"We really wish some of our Legislators would make themselves better acquainted with practical matters before they go theorizing on subjects they do not understand. Philosophers of old committed just the same blunders in science these men make in business; and it was not until they were taught

that experiment was the test and touchstone that they made any progress in useful knowledge. We strongly urge some of our M.P.s to go to the same school, and not before they have made themselves proficient, to meddle with subjects which, with all due deference, we say, they do not understand."

The advice of the able editor, given in the closing paragraph may be as useful to other Legislators as to M.P.s.

#### Railroad Connection.

The following account of a meeting in relation to a connecting link between the "Central" and "Georgia" railroads is from the Savannah Republican of July 26th.

**Railroad Meeting in Hancock.**—On the 23d inst., according to previous notice, the citizens of Hancock county held their railroad convention at Sparta. R. P. Sarsnet, Esq., was called to the chair, and Mr. Johnson was appointed secretary.

The chairman explained the object of the convention, and Judge Thomas, after some remarks, called out Judge Andrews, of Wilkes, who entered into a detailed statement of the advantages and certain profits of the proposed road. R. R. Cuyler, Esq., the president of the Central railroad, then addressed the meeting at some length. He was followed by the Hon. R. Toombs, who made a most eloquent and statesmanlike speech, informing the meeting that Wilkes county was pledged to subscribe \$200,000 cash towards the proposed road, and calling for a cash subscription on the part of Hancock of \$100,000. This was responded to on the spot by a subscription of near \$60,000, and not a doubt is entertained that the amount can be easily made up. In addition to these subscriptions, we learn that further subscriptions will be secured in Taliaferro and Washington. Savannah will be called upon to make up the deficit.—A subscription of \$100,000 on the part of the railroad will leave \$100,000 to be made up by citizens. *It cannot, it will not be,* that the people of Savannah will stand still and fold their arms in view of this new avenue to prosperity. An avenue so sure to return to us almost immediately, all that is paid out, whether by the Central road or by stockholders. Accurate returns made, show that the business of this road must at the very beginning, amount to more than \$100,000 per annum, and every stockholder will be interested in its welfare.

The assumed cost is \$500,000, or perhaps with its equipment rather more. Allowing the most extravagant estimate for the expense of running and repairs—this will pay back 7 per cent. interest, and leave an annual surplus of 15, or \$20,000.

Savannah has her part to perform. Will her citizens forget every cause of local disunion and dissatisfaction, and come forward to the work? There are no words, there is no declamation to be expended here. Action—action—are the requisites. Here is an object before which the most cherished of our individual projects

"Loses discountenance, and like folly shows."

The proposed railroad communication will intersect the Central railroad perhaps at Tennille, or, say 135 miles from Savannah.—From Tennille to Cumming, the point of its

intersection with the Georgia railroad, is 45 miles, from Cumming to Atlanta 113. Total distance from Savannah to Atlanta, 393 miles, against 292 miles via Macon and the Macon and Western road. If, however, (which is not improbable,) the point of intersection with the Central road be at Hardwick's which is some 13 miles nearer Savannah, the whole distance to Atlanta will be shorter by at least eight miles than by way of Macon, and that, too, without increasing the distance between the two roads more than two or three miles.

We need hardly add to this brief account of the proceedings in Hancock that the meeting was a large one, and the determination just such as our fellow citizens ought to have been present to have witnessed. We have been seeking a connection with Augusta and the Georgia railroad. The resolute action and the firm State feeling of our brethren in Wilkes and Hancock have pointed out the route—upon the result will depend whether Georgia is to be indeed the "Lion" of the south, or whether she shall only develop her resources for the advantage of Charleston. Such is the plain—the direct—the undeniable issue involved; and it need not be blinked.

#### Louisville and Frankfort Railroad.

A sufficient sum having been subscribed, says the Frankfort Commonwealth, of July 27th, an organization of this company by the election of six directors, will take place in Louisville on the 14th day of August. As soon as the organization is complete, proper surveys and estimates will be made, and gentlemen who are disposed to encourage the enterprise will be able to act understandingly.

It is useless for us to say anything by way of argument, to prove that the road is needed. That it is needed, is conceded by all. Kentucky, with the best soil in the world, is unable even now to compete with her more enterprising neighbors in the markets on the Ohio and Indiana border of the State. The facilities for transportation which Ohio enterprise has given to the people of that State, give them advantages that are incalculable. Indiana, too, is rapidly increasing her wealth and importance by the construction of railroads and canals. Kentucky alone seems to have forgotten herself in the general march of improvement. Central Kentucky is very deeply interested in the railroad to Louisville. The counties through which it is destined to pass, we are gratified to learn, are taking a lively interest in its success. And well they may; for upon the construction of the road depends in a great measure the value of their possessions. The only reason why land in Henry and Oldham and Shelby is less valuable than that in the immediate vicinity of Louisville, is, that the owner of the former has no market for his surplus, while the latter has a market at his door. The railroad, if constructed, will bring a good market within reach of every man on or within any reasonable distance of the route.

As soon as the company is organized, we will lay before our readers a statement of the probable cost of the road: and we hope that

the citizens in the interior will, in the mean time, reflect upon the undertaking, and will lend a helping hand. The city of Louisville will, we are assured, do her part towards the completion of the road. It is for the counties along the line, and those interested in the interior, to determine whether the road shall progress or shall fail.

We are pleased to learn that efforts are about to be made to complete this road to Louisville. It ought long since to have been done. It is not yet too late, however, if the people of Louisville, along its line, and at, and beyond Frankfort, will do their duty; or consult their own interest.

We should regret deeply, on account of the completion of this work—if there were no other grounds for regret—the death of the gallant and high-minded McKee. He looked forward to its completion at an early day, with confidence and pleasure; but other duties called him away from its management, and he now sleeps quietly beneath the green sod of his own beloved Kentucky, though he nobly fell far, far away.

#### Richmond and Ohio Railroad.

The following account of the proceedings of a meeting recently held at Lynchburg, Va., are from the *Virginian*, published at that place. From this we infer that the people of Lynchburg and its vicinity are moving with the right spirit in favor of this important work—and well they may, as it will open to them, when it shall be completed, a new world of business, and give new life and increased wealth to the Old Dominion. It is well said in the preamble, that "the time for action, UNITED AND VIGOROUS, has arrived;" and it becomes the people of Virginia now to move in a body, to ensure the opening of this work at the earliest possible period.

At a meeting of the citizens of Lynchburg, friendly to the Richmond and Ohio railroad, convened at the Universalist Church, on the 24th day of July, 1847, Mr. Richard G. Morris was called to the chair, and William T. Yancey appointed secretary.

The meeting was ably and efficiently addressed by Messrs. James Garland, Francis B. Deane, Jr., R. J. Davis, and Gen. Peter C. Johnson, of Abington, and the following preamble and resolutions, offered by Mr. R. J. Davis, were unanimously adopted.

Whereas this meeting is fully impressed with the belief that nature has marked out, through the heart of central Virginia, the line of a great thoroughfare for a large portion of the commerce of the west—an opinion founded on facts which cannot be controverted, among which are the following: that the distance, from the centre of production in the valley of the Mississippi, to the Atlantic coast, and to the great centre of commerce of the Atlantic States, along that line, is less than any other route; that the highest elevation to be overcome upon it, as also the general inclination of its ascending and descending planes, is also less than any other line which approximates it in distance; that all the materials necessary for the construction of such a thoroughfare exist everywhere along its route in the greatest abundance, so as to admit of its construction on the most favorable terms; that the climate of the region which it traverses is so mild as scarcely ever to afford any obstruction to the transportation of

passengers or freight, and that such a thoroughfare, if a railway, may not only be made unbroken and continuous through the limits of Virginia, but may be extended from its western terminus on the Ohio upon the same parallel of latitude, in an unbroken and continuous line, to the city of St. Louis.—Therefore, the construction of a great thoroughfare, along the line so marked out, is demanded not only by Virginia, for the purpose of unfolding her internal resources, but also by the union for the purpose of affording an outlet to the growing commerce of the west, and enabling the United States to supply the foreign demand for their agricultural productions.

And whereas, the united testimony and experience of the great States of Europe and America has conclusively tested the adequacy of iron railways to subserve the great interests of commerce, agriculture and manufactures, and the charter of the Richmond and Ohio railroad, well matured, liberal in all its provisions, and broad and comprehensive in its design, providing for the construction of a road through a region of Virginia, rich in agricultural and mineral resources, and admitting of its connection with a feeder, of moderate length, to the still greater agricultural and mineral treasures of the southwest, affords a favorable opportunity for establishing, on the line so designated, a thoroughfare in all respects commensurate with the great objects in view.

And whereas, this meeting is also deeply impressed with the conviction that the time for action, UNITED AND VIGOROUS, has arrived—that the golden moment is now present, when the most energetic steps should be taken, not only because the time fixed by the charter for the commencement of the work is passing away; and not only on account of the tendency of other works in Virginia to divert attention from the great scheme, and the Herculean efforts of the Atlantic States to wrest from Virginia the commerce of the west; but also for the purpose of arresting the attention of the projectors of the great railway extension from St. Louis, through the valley of the west to the Ohio, in order that we may induce them to co-operate with us, and unite that great improvement with the Richmond and Ohio road.

And whereas, books of subscription to the stock of the proposed road have already been opened, and a large amount subscribed, and consequences very detrimental to the success of the work would be produced if the efforts of its friends should now be relaxed, and this meeting is also of opinion that, if strenuous exertions should now be made along the line of the proposed improvement, and the people aroused to a sense of its importance, and the prospects of its success, and the danger of inaction, the charter could be secured; and finally, as this meeting is further of opinion that a convention of delegates, from the several counties interested in the work, to assemble at this place, at as early a day as would be convenient, for the purpose of taking the whole subject into consideration, and encouraging subscriptions to the stock, and further-

ing the success of the work, would materially promote the great objects in view,

1st. Resolved, That the counties along the railroad proposed to be constructed from Richmond to the Ohio river, and other adjoining counties desiring to promote its construction, be, and they are hereby invited to appoint delegates to a convention to be held in the town of Lynchburg, on the 22d day of September next, for the purpose of taking the subject into consideration, and adopting such measures as to them shall seem advisable, for promoting subscriptions to the stock, and securing the success of the work.

2. Resolved, That Francis B. Deane, Jr., Richard K. Cralle, Robert, J. Davis, Wm. M. Blackford, Robert H. Glass, James Garland, John Wills, Benjamin F. Sackett, Robert H. Gray, Adolphus D. Read, Richard G. Morris and Wm. T. Yancey, be appointed a committee, whose duty it shall be to correspond with persons residing in the counties in the foregoing resolutions mentioned, and in the seaport towns, in order to direct their attention to the importance of the work, and to interest them in procuring the appointment of delegates to the proposed convention, and also to collect such information as they can, in reference to the products and minerals of these counties, the disposition of the people as to the construction of the road, and on any other topics which are calculated to advance that object.

3. Resolved, That Maurice Langhorne, Jr., Henry Davis, Pleasant Partin, Paul Jones, James M. Langhorne, Robt. H. Gray, Wilson P. Bryant, Daniel I. Warwick, W. B. Averett, John W. Dudley, Wm. S. Reid, Jr., and Col. Wm. B. Brown, be appointed a committee to provide a suitable place for the sittings of the convention, and also to provide for the reception and entertainment of such delegates as shall attend it.

Resolved, That the Lynchburg, Richmond, Fincastle, Wytheville, Charlestown, (Va.,) and Jonesborough, (Penn.,) papers, be hereby particularly requested to publish the proceedings of this meeting.

And the meeting then adjourned.

RICHARD G. MORRIS, Pres't.  
W. T. YANCEY, Sec'y.

We have heretofore taken ground for the commencement of the work at Lynchburg, and its construction westward from that point by sections, thus making it tributary, until its completion to the Ohio, to the James river canal—upon which so much capital has been expended by the State. This course would ensure to the canal an amount of business which it can never have without the railroad—and the company would accomplish the greatest amount of good with the least outlay of capital—and this part of the road, when completed, will ensure the construction of the work from Lynchburg to Richmond.

Of the importance of a railroad from the Ohio, through the southern part of the State, to tide water, at Richmond, or elsewhere, we presume there is no difference of opinion in Virginia—there certainly is none in our mind; yet we can well imagine that it will be somewhat difficult to raise within the State the capital required. It is however highly important—we must be allowed to assure the people of the

State, and of Richmond and Lynchburg in particular—that a good commencement be made by them before they can expect capitalists from abroad to invest largely in the work—it *must be commenced in Virginia*—then others will invest, if, as is intimated by an eminent engineer, the charter is made acceptable to capitalists.

We have been furnished with a copy of a correspondence between F. B. Deane, Jr., Esq., of Lynchburg, and Moncure Robinson, Esq., the gentleman above referred to, and we take the liberty of republishing nearly the whole of Mr. Robinson's letter, for the purpose of sustaining our own views in relation to its connection with the canal at Lynchburg or its vicinity, as well as for the purpose of laying the views of that gentleman, in relation to this work, before our readers. Mr. Robinson says:

It is evident whatever route may be taken by such a railroad, that it would be expedient to form a connection between it and the James river canal, either at Lynchburg, or some point west of Lynchburg, and that a very different plan of improvement would be advisable east and west of such point of connection. *East of it*, there would certainly be no occasion for anything more than a single track railroad, adapted to the transportation of passengers and light and valuable goods, and I have little doubt that, for a long time, it would be most expedient, in this portion of the railroad to make use of a plate rail superstructure, similar to that in the northern and southern line of railroad through Virginia. I would advise this course in the first instance, not only on account of the diminished first cost of the work on such a plan, but because, waiving this consideration, the excess in the annual expenses of the cheaper work, in this portion of the route, would not probably for many years equal the interest on the difference in cost, between a plate rail and edge rail superstructure. On the other hand, whenever it might be expedient to change the one for the other, no very material loss would be sustained, old railroad iron being always saleable for a large proportion of its original cost.

We may judge of the economy with which such a work would be constructed along any one of the ridges in Virginia, between tide-water and the mountains, (for in their topographical features they resemble each other closely,) by the cost of the Louisa railroad, which was constructed at a much earlier period than the present, for about \$8,000 per mile.

*West of the point* where the contemplated work would touch, or be connected with the canal, a very different plan would be advisable. As on the western portion of the railroad, a *heavy trade* as well as travel might be expected, it would be expedient to construct this part of the work as free as possible from objectionable grades and curves, and it would be advisable in the course of a few years, though I think not in the beginning, to lay down an edge, or heavy iron rail superstructure. There is nothing, however, in the topography of this portion of the route, which induces me to believe that a railroad between the point at which it would connect with the canal and the Ohio, would be peculiarly expensive.

A large portion of the road, in every trace which might be adopted, would be along the valleys or streams, and though these in mountainous districts present often points of a good deal of difficulty, yet there is always less difficulty in securing suitable grades in valleys, than there would be in crossing alternately *vallies and ridges*, involving as these do frequently deep cuttings and fillings in comparatively a champaign country. In even the most difficult passes on the western portion of the route, it would be no very serious matter to effect the graduation for a *single track* railroad, and, on the plan of improvement which I would recommend as most eligible for the work in question, it would, probably, rarely be necessary to grade for a double track on portions of the route presenting particular obstacles.

My idea is, gentlemen, that while the eastern portion of the route need be only a single track railroad, with turnouts at suitable distances, the western should be a double track road, for a sufficient portion of its length to prevent any risk of embarrassment in the movement of trains, for the largest amount of tonnage, which in view of the numerous works which will undoubtedly be executed between the east and west, can be reasonably anticipated in the contemplated improvement. Taking the most enlarged view of this matter, and executing enough of the work a double track, to answer any demands of trade and travel which the work may be expected to command, still a large portion of the western division of the work, or that beyond its point of connection with the canal, may be, without material disadvantage, a single track railroad. It will then be requisite only, so to adjust the plan of the improvement as to make those portions of the western division double track, where for long distances an increased breadth of roadway would be attended with no greatly enhanced expense; and to reverse the case where for a long distance, (as in the New River cliffs,) a single track would be comparatively a slight, and a double track a very serious matter, to have all or nearly all the advantages of a double track railroad, at a greatly diminished cost.

Executing the work on the plan which I have sketched above, I have no doubt that Virginia may have, between Richmond and the Ohio river, a work, *superior in value to any similar work now existing or in course of execution between the east and west*, for not exceeding in the first instance *eight millions of dollars*. And when the trade and travel shall have accumulated on such a work, to an extent sufficient to make it expedient to substitute the original superstructure by a heavy iron rail, the work itself will, at the same time, furnish abundantly the means of accomplishing the object.

Your second inquiry is, gentlemen, "How far would such a work be a profitable one to the stockholders?"

Of course any reply to this inquiry must be based on the presumption that the act of incorporation would be a liberal one. In this event, the results of the business of the

Baltimore and Ohio railroad company, for the past year, furnish us very certain data for answering your question.

It appears, from the last report of the president and directors, that the gross receipts of the company from its main stem, for the year ending the 30th of September, 1846, were \$895,315 22 and that its *net revenue*, "after deducting the expenses of working and keeping the road in repair, amounted to the sum of \$440,475 34,—being \$65,713 60 greater than the previous year, and more than 6 per cent. upon the capital of the company." These are the results of a work which when completed will have a plan and profile very inferior to what may be attained on the Virginia line of improvement which will terminate at a point on the Ohio less favorable for commanding the trade of the west, and which so far as completed, has cost more than seven and a half millions of dollars, or nearly as much as the whole line between Richmond and Guyandotte, I leave you, gentlemen, to deduce the result from these data, satisfied in my own mind that no work which can be projected in Virginia could be as profitable to the parties executing it, whether the State or individuals, as assuredly none could diffuse more widely extended benefits, both to the State and the Union, than the one to which your inquiries are directed.

Your third inquiry is, "Would it be practicable to raise the capital stock for such a work, under an act of incorporation which would exempt the stock and property of the company from taxation, until the dividends should exceed six per cent., and which would guarantee the company for the term of thirty years from the completion of the work, from the competition of a line of railroad connecting the Baltimore and Ohio railroad with the Ohio river below the town of Wheeling?"

If, in addition to the provisions suggested by you in an act of incorporation, the work as contemplated was made (on the plan of the English and some of the northern roads) the property of the stockholders, allowing them the right to regulate the tolls as they might deem fit, and the company were also allowed to commence the work as soon as a subscription should be made up sufficient to insure its *bona fide* prosecution, I cannot doubt that the stock requisite for its commencement would readily be taken, and I have as little doubt that the work once commenced, would rapidly progress to completion. I can see no objection to these provisions in comparison with the objects to be attained by them. The State may effectually guard against the line being *tied up* in an act of incorporation, by a provision, that whenever the work shall cease to progress at the rate of at least thirty or forty miles annually, the privileges of the company, *as regards the unfinished portion*, shall be forfeited. Supposing such a result, the legislature would have effected, by means of the act, a portion more or less, if not the whole, of the work in question, and it would be proportionally less difficult to secure the execution of the remainder of the line.

As regards an unrestricted charge, there can scarcely be a doubt that the interests of

the company will always dictate lower rates of charge, than any limits which might be given in a charter, *unless in the case of an inconvertible currency.* But every prudent capitalist will, in making large investments, look to such a contingency, and it is evident that an act of incorporation which leaves to a company the power to regulate its charges according to the medium in which they may be paid, will be more valuable for such a feature, and present more chances of the stock being taken up under it.

With an act of incorporation containing the above provisions, there would, in my opinion, be no occasion for the grant of the unusual privileges as regards the purchase of large bodies of land, manufacturing, etc., given in the act of incorporation of the Richmond and Ohio railroad last winter, while the feature of a charter suggested in this, and which would probably be deemed by the legislature much less (if at all) exceptionable, would certainly be much more efficient in commanding the requisite capital.

In your communication you add, "we should be pleased, in addition to your response to the foregoing interrogatories, to receive your views in relation to the practicability, utility, importance, and cost of constructing the proposed railroad from Richmond on the south of James river to the Ohio, and the probability of securing subscriptions to stock in the same, provided there be a reasonable charter."

All the reflection and examination which I have given to the subject have induced the impression, that the most eligible route for a railroad between Richmond and the Ohio, would be probably on the south side of James river, passing through the counties of Amelia and Nottoway, and thence, either by the valley of the Staunton river, or by Lynchburg and the valley of Virginia, to the New river, and afterwards along the valley of New river, either to the mouth of Kanawha, or diverging below Charleston to Guyandotte;—but it seems to me, as the interest of the company and the commonwealth would be identical to having the railroad made on that route which would combine the greatest advantages, there could be no objection to leaving to the former the widest scope in the location of its work; excluding it only from the immediate valley of James river below Lynchburg, as in the act of incorporation of the Richmond and Ohio railroad company of last winter. Its western terminus being on the Ohio river, at or below the mouth of the Great Kanawha, whether its eastern was at Richmond, at Gordonsville, or at some point on the Richmond and Petersburg, or the Clover Hill railroad, might, it appears to me, be safely left to the stockholders to decide; and it would I have no doubt, aid materially the accomplishment of the object in view to do so, because the charter of the company would thus be presented in the most attractive form to capitalists.

I have thus given you, gentlemen, frankly my reply to the queries proposed by you. It is in the power of Virginia, possessing as she does the most advantageous route for a

railroad between the east and the west, to have, if she wills it, such an improvement. But there are two modes only of effecting the work. It must be either executed by the State herself, with her own means, or if she wishes it effected by private capital, she must give such an act of incorporation as will satisfy capitalists of the probable productiveness and security of an investment in it.

I am, gentlemen, with great respect, your obedient servant, MONCURE ROBINSON.

#### Baltimore and Ohio Railroad.

Continued from page 502.

#### Statement of B. H. Latrobe, Esq., to the President of the Baltimore and Ohio Railroad Company.

The three routes, nos. 1, 2 and 3, being brought into the comparison together, present the following relations to each other, as regards length and cost:

Description of route.	Actual dist. in miles.	Estimated cost of construction.	Estimated cost of working.	Total estd. cost of construction and working.	Diffs. of cost compared with No. 1.
		Dolls.	Dolls.	Dolls.	Dolls.
Wh. ck.	61 1/4	2,753,707	2,708,398	5,462,105	
Gra. ck.	62	2,567,322	2,656,801	5,224,123	237,982
Fish ck.	66 1/2	2,423,018	2,524,892	4,947,910	514,195

So that the Grave creek route (No. 2) is cheaper to "construct, maintain and work," than the Wheeling route (of 1844) by \$227,982.

And the Fish creek route (No. 3) is cheaper to "construct, maintain and work," than the Wheeling creek route (of 1844) by \$514,195.

While, as stated in the report, the Fish creek route (No. 3) is cheaper to "construct, maintain and work," than the Grave creek route (No. 2) by \$276,213.

#### Letter and statement of Jonathan Knight, Esq., to the President of the Baltimore and Ohio Railroad Company.

Estimated length of road, and estimated cost of construction, with one track.

143 1/2 miles from Cumberland to mouth of Piles' fork, estimated by B. H. Latrobe, in the year 1843.....	\$4,150,125
61 1/4 miles from mouth of Piles' fork to Wheeling, by J. Knight's route of 1844, as estimated by B. H. Latrobe.....	9,138,707
205 miles from Cumberland to Wheeling.....	6,268,832
143 1/2 miles from Cumberland to Piles' fork, as above.....	4,160,125
62 miles from mouth of Piles' fork to Wheeling, by the combination route, partly by the route of 1844, and thence by Grave creek, 1847.....	1,947,322
205 1/2 miles from Cumberland to Wheeling.....	6,097,447
143 1/2 miles from Cumberland to mouth of Piles' fork, as above.....	4,150,125
65 1/2 miles from mouth of Piles' fork to Wheeling, by way of route of 1847, that is, by forks of Fish creek, Bigrun, and Grave creek.....	1,869,509
209 1/2 miles from Cumberland to Wheeling.....	6,009,634
143 1/2 miles from Cumberland to mouth of Piles' fork, as above.....	4,150,125
73 1/2 miles from mouth of Piles' fork to Wheeling, by way of the mouth of Fish creek, as estimated in 1847, by J. Knight.....	1,721,534
217 miles from Cumberland to Wheeling.....	5,871,659
143 1/2 miles from Cumberland to mouth of Piles' fork, as above.....	4,150,125
66 1/2 miles from mouth of Piles' fork to	

Wheeling, by way of the mouth of Fish creek, as estimated by B. H. Latrobe, in 1847..... 1,756,018  
210 miles from Cumberland to Wheeling..... 5,908,143

Very respectfully,  
Hon. Lewis McLane,  
President Baltimore and Ohio Railroad Company.  
Baltimore, July 6th, 1847.

Columbus, June 26, 1847.

ALFRED KELLY, Esq.

Sir,—The City Council have this day appointed you a delegate to represent this city at a meeting of the Baltimore and Ohio railroad company, to be held at the city of Baltimore. The City Council authorized me to request you to accept the appointment.

I am, sir, very respectfully yours,  
R. W. McCoy, Pres't City Council.

Baltimore, July 2, 1847.

TO THE HON. LOUIS McLANE,

Pres't Balt. and Ohio Railroad Co.

Sir,—At your suggestion I promised to commit to writing the substance of the information and views which I as a delegate of the City council of Columbus, had the honor to communicate verbally to yourself and committee on yesterday. For the sake of perspicuity, and, as far as practicable, avoid repetition, I shall consider the subjects under different heads.

*The object to be attained by adopting a proper terminus on the Ohio river for the Baltimore and Ohio railroad.*

This object unquestionably is to secure the greatest amount of travel and profitable transportation to the road. It will, as it seems to me, be best attained by carefully considering and correctly determining what portion of the travel and trade of the great west can be attracted to and secured upon the road. It is vain to contend for that which nature has placed beyond our reach, and useless, or nearly so, to grasp that which we cannot hold. No one railroad, or other channel of trade or travel can ever become the sole line of communication between the great basin of the Mississippi and the Atlantic seaboard. No one channel, formed by the hand of man, can be of sufficient capacity for the mighty mass which must soon flow in this direction. A portion, I may even say, a comparatively small portion is all that any one railroad can accommodate—it is all that even the most aspiring need ask.

Both the trade and travel of the country in the vicinity of the great lakes, will most naturally, and, as I believe, ever seek connexion with the more northern cities of the Atlantic seaboard and with Canada, through the lakes—the St. Lawrence—the New York canals, and the railroads which are or will be constructed, for the conveyance of passengers and more or less freight at all seasons of the year—and to answer as lines of transportation when the navigation is closed. Canada frequently affords the best market for the surplus breadstuffs and provisions of this region—and when this is not the case, the higher price which these articles almost always command in New York and Boston, than in the more southern cities, operates as a controlling inducement for the holders of these arti-

cles to send them to market in this direction. The fact that most articles of domestic manufacture and nearly all of foreign growth and manufacture, can be purchased somewhat cheaper in Boston and New York than in the more southern cities, also attracts to them the trade of that portion of the west which can reach them without a great increase of distance and expense of transportation beyond that attending transportation to and from Philadelphia and Baltimore. Tobacco, and, perhaps, some other agricultural productions, form exceptions to this rule. But this is an article which is not cultivated for foreign markets in the country adjacent to the great lakes.

A considerable portion of the travel between this region and the Atlantic cities, particularly in the winter season, takes a route as far south as the National, or Cumberland road. I apprehend this will continue to be the case so long as equal facilities are offered by railroads, or other modes of conveyance on this route. Washington, to say nothing of Baltimore and other places, is a great point of attraction to those who travel for pleasure, and even for those whose principal object is commercial business. And this attraction exercises an annually increasing influence. This portion of the travel between the country adjacent to the great lakes and the Atlantic cities, the Baltimore and Ohio railroad may reasonably expect to grasp and hold by a judicious selection of the route and western terminus.

The surplus productions of that portion of Ohio, Indiana, and Illinois, which is adjacent to the Ohio river, naturally seek a market in New Orleans and the states situated on the Lower Mississippi and the gulf, except at times when the price of these productions is greatly depressed as compared with the prices in the great commercial cities on the Atlantic. When this is the case, these productions are sent to market either by means of canal and lake navigation to New York and Canada, or by the Ohio railroads and canals to Philadelphia or Baltimore. Much the larger portion of these products, except from the country in the vicinity of the canals of Ohio, floats down the Ohio and the Mississippi. Such, I apprehend, will continue to be the case for many years to come, and, perhaps, for ever. To these remarks there are, however, some exceptions. Much of the surplus produce of the eastern counties of Ohio, which are bounded on the Ohio river, is now sent to Baltimore by way of the Cumberland road and Baltimore and Ohio railroad, or to Philadelphia through the canals and railroads of Pennsylvania. Tobacco and live hogs pursue one or other of these routes, mostly the former, even from the central portion of Ohio. The completion of the Baltimore and Ohio railroad to a proper point on the Ohio—especially if connected with a railroad penetrating the interior of Ohio would greatly increase this trade.

The travel to and from the southern portions of these great states would be much more readily, and in much greater proportion, attracted to a railroad in this direction

than its export trade; as would also the transportation of goods from the Atlantic cities, to this region. All articles of merchandise, of great value as compared with their bulk and weight—such as dry goods, are now, almost all, brought to this section of the western country directly from the eastern cities by canals, railroads, or wagons. A continuous line of railroads from Baltimore to Cincinnati, and through the central regions of Ohio, Indiana and Illinois, would engross a very large portion of this transportation.

*The country whose trade may be successfully contended for by the Baltimore and Ohio railroad is, however, principally comprehended by the eastern and central sections of Ohio, and the central sections of the great States lying west of Ohio. I here use the word central in contradistinction from the northern and southern sections of these states. No other line of transportation from the Atlantic seaboard, except one from Philadelphia via Pittsburg, will be likely to compete with it, with any reasonable prospect of success, so far as the importation of merchandise, particularly the lighter classes of goods, is concerned. And even the southern portions of these states will be supplied with this kind of goods principally through this channel, as I have already suggested is now the case.*

In regard to travel between the east and the west, the road may justly lay claim to even a larger share. Two great streams of travel—one coming from the west, the other from the southwest, will meet in Ohio in their progress towards the northeastern and eastern cities of the Union. A large portion of this travel, whether induced by pleasure, the pursuit of health or business, will take a route by way of the great lakes, Niagara Falls, and western New York, to Boston, and, having passed from thence through New York, Philadelphia, Baltimore, and, perhaps, to Washington, will return by way of the Baltimore and Ohio railroad. An equally large portion will reverse this order of proceeding, passing over the same ground, but in the contrary direction. Another portion will proceed to some one or more of these Atlantic cities, and return by the same route—the variations depending on the season of the year, the business, or the inclination of the traveller.

Whether this travel will pass along the Baltimore and Ohio railroad or through Pittsburg to Philadelphia, will in a great degree depend on the facilities offered by each for easy, safe, cheap, and expeditious travelling. The length or shortness of the line, other things being equal, will of course form an important item in the decision of this question. To those who wish to visit all the cities which I have named, it will be a matter of some consequence to take them in course by beginning at one end of the row and ending at the other. Thus, if a traveller commences at Boston and visits these cities in his course, he will naturally feel disposed to commence his journey west from Baltimore, rather than take his back track to Philadelphia, and vice versa, unless business

or a decidedly better route should induce a different decision.

*Where is the best point for terminating the Baltimore and Ohio railroad on the Ohio, with reference to securing the great objects to which I have adverted? The answer is:*

That point which can be reached by a railroad from the centre of Ohio by the shortest distance—passing over the most suitable ground for that purpose—when a railroad will be most certain to be soon made, and which, from its location, will attract the greatest amount of business, and be most certain to secure it to the Baltimore and Ohio railroad.

What point on the Ohio river, which is accessible by the Baltimore and Ohio railroad, unites in the greatest degree these advantages?

Several points below Wheeling—Wheeling and Pittsburg have been named. I propose to submit a few remarks as to each of these—premising that as my knowledge of the localities east of the Ohio river are very limited, so far at least as they present facilities or obstructions to the making of a railroad, I leave this division of the question out of view.

In regard to the several points proposed for the western terminus of the Baltimore and Ohio railroad, below Wheeling, it should be observed that all these points are opposite to a comparatively poor and thinly peopled part of the State of Ohio—as will be seen by reference to the official tabular statement of the valuation of the real property of the several counties of the State of Ohio. A portion of the state which is able to contribute little to the cost of constructing a railroad, or towards the travel and business by which it is to be sustained when made. All this section is exceedingly rough, presenting great obstructions to the conducting of a railroad through it, unless a route is selected which lies along the valleys of the streams. So evident is this, and so fully is the fact conceded by the citizens of this region, that the representatives in the Ohio Legislature from some of these counties three years ago introduced a bill for constructing a railroad from Washington county to Columbus by way of the valley of the Muskingum or Hockhocking, supposing that the Baltimore and Ohio railroad would terminate on the Ohio opposite some part of Washington county, and this was designed to connect the Baltimore and Ohio railroad with the western and central parts of Ohio, and even with Cincinnati. This charter was so amended during its progress through the Legislature, as to give the company the right of making the road from Franklin county to any point on the Ohio where the Baltimore and Ohio railroad might terminate. Were this termination opposite the mouth of the Muskingum or the Hockhocking, or any point between the mouths of those rivers, it would then, as I believe, be found the best route even to Cincinnati, to follow the valley of one or other of those rivers to the margin of the level country—cross the Scioto, as high up at least as Pickaway county, and proceed thence to Cincinnati.

It is possible that a practicable route from the Ohio to the margin of the level country at Newark may be found by the valleys or rather ravines of Sunfish—the Seneca and Buffalo branches of Wills creek, the east branch of Salt creek, and thence by the valleys of the Muskingum and Licking rivers to Newark. This route between the Muskingum river and the mouth of Sunfish, lies through a rough and comparatively poor and thinly settled part of the state. It is also presumed that numerous short curves, wash banks and crossing of the streams must be encountered in passing along the ravines of these streams.

It is known that a good route for a railroad from Wheeling to Columbus is presented by the valleys of Indian Wheeling—Still Water, the Tuscarawas, Muskingum, Tomaka, and Licking, to Newark, and thence across the open country to Columbus. The feasibility of this line is demonstrated by the actual construction of the Ohio canal from a point opposite the mouth of Still Water to Newark, by actual surveys, for a canal or slack water navigation, along the valley of Still Water; and a survey thence to the mouth of Wheeling creek, made some years ago with a view to the construction of a railroad.

That part of this route which extends from Newark to Columbus, is through a plain or open country, which it is known presents no obstacles worthy of note.

The distance by this route, from Wheeling to Columbus, I estimate at one hundred and fifty-two miles, viz:

From Wheeling to mouth of Still Water, 50 miles.	
Mouth of Still Water to Newark.....	69 "
Newark to Columbus.....	33 "
Total distance.....	152 "

The only portion of this route in regard to the length, of which there is any material uncertainty, is between Wheeling and the mouth of Still Water. And to the length of this portion, ascertained by dividers set to five miles, and stepped on the most accurate map along the route, I have added eight miles; which is, as I believe, more than sufficient to cover the additional length caused by short curves, or departures from the general course. The railroad distance from Columbus to Cincinnati, either by way of Xenia or Springfield and the Little Miami railroad, or by way of Springfield, Dayton, and the valley of the Great Miami, is about 120 miles, making the total distance from Wheeling to Cincinnati 272 miles.

It is possible, perhaps probable, that shorter, and, on the whole, better routes may be found between Wheeling and Newark, than that above designated. But to point out one known to be feasible and reasonably direct, is sufficient for my present purpose.

A favorable line for a railroad from Columbus to Pittsburg is also presented by the valleys of Licking—Tomaka—Tuscarawas—the Sandy—Little Beaver or Yellow creek—and the Ohio river from the mouth of one or the other of these latter streams to Pittsburg.

This route is identical with that above indicated from Columbus to the mouth of Still

Water. The distance from this point to Pittsburg, by the valleys of the Tuscarawas, Sandy, Little Beaver, and the Ohio railroad, I estimate at 116 miles. From the mouth of Still Water to Pittsburg, this line, however, presents more difficulties than that portion of it which extends from the mouth of Still Water to Columbus. The valleys are more crooked, more contracted, and in other respects less favorable in their character. Still, no serious difficulties are interposed.

*To which of the points proposed as a western terminus of the Baltimore and Ohio railroad, will a railroad connection from Cincinnati and the western and central portions of Ohio most certainly and soonest be made?*

I believe, to Wheeling. A railroad is already finished and in successful operation from Cincinnati to Springfield, via Xenia. A company is formed, and the requisite amount of stock taken to construct a road from Xenia, or Springfield, as the company may elect, to Columbus. Surveys are now being made, preparatory to putting a large portion of this road under contract. It will probably be finished in two years or less. There is thus left of railroad to be provided for, in order to reach Wheeling, but 152 miles. Books will soon be opened for the subscription of stock to a company incorporated to make this road, and if it be known that the Baltimore and Ohio railroad will soon be made to that point, it will operate as a powerful stimulant to the enterprise.

The means cannot, as I apprehend, be as soon procured for making a railroad from Columbus to Pittsburg, for the obvious reason that the distance is some 66 to 70 miles greater, and the sum required to construct the road, in that proportion, at least, greater. Besides, I think it presents the people of central Ohio a longer and somewhat less desirable route for reaching the Atlantic cities.

*Which of the proposed connexions will attract the greatest amount of western trade and travel?*

In reference to this question, Wheeling and Pittsburg may be supposed by many to occupy nearly the same position. It, however, appears to me, after a careful consideration of all the attendant circumstances, it will be found that the Wheeling route has the decided advantage. A route from Wheeling west, passes more centrally through the great States of Ohio, Indiana, Illinois, and Missouri. It approaches nearer the great and growing city of Cincinnati, and the northerly bend of the Ohio, the point where a large portion of the passengers who come up the Mississippi and Ohio in steamboats, even now, leave the river, and proceed by land to the eastern cities. It passes at a greater distance from the lake, and is therefore less likely to lose its business by the attractions of that route.

If to attain the same ground, a route from Pittsburg west incline so far to the south as to pass through the centre of Ohio, and thence onward in the direction of St. Louis, the length of the route is considerably increased, and, as a consequence, rendered more expensive and less desirable as a route for travel or trade.

A route either from Cincinnati or Columbus to any point on the Ohio below Wheeling, would attract to the Baltimore and Ohio railroad less business than either that to Wheeling or that to Pittsburg, for reasons previously hinted at. It must pass through a far less populous, less productive, and poorer country, and one ever likely to remain so, while one more populous, wealthy and productive, lying further north, will not be accommodated by it, and will therefore seek another route, construct a rival road, and form other connections. It is true, that at certain seasons passengers and freight coming up the Ohio, may with more convenience reach a terminus lower down the river.—These periods, however, are of short duration, for generally when a steamboat can reach Parkersburg, it can pass on to Wheeling, and at all such times it makes little difference to a passenger whether he travels by water a few miles further, or by land a few miles less, or the reverse. But I apprehend the principal business of the Baltimore and Ohio railroad is not to be derived from the river, but from the land; that is, it will be approached to a far greater extent by means of roads than by means of river navigation.

One question only remains to be considered, viz:

*Which of the proposed termini will most effectually secure to the Baltimore and Ohio railroad that business to which, as I have endeavored to show, it has a fair claim?*

I answer, that terminus which is situated nearest in a direct line between the points which are proposed to be connected—provided it be upon as favorable a route for the construction of a road or system of roads—and pass through a country as fertile, populous and wealthy, as its rival routes.

In my view, Wheeling, or some point near it, occupies this position. This consideration induced the making of the National road through this point. I have before shown that at least one favorable and pretty direct route, leading west from this point is presented, and that a system of railroads from Cincinnati, through the central region of Ohio, is either made or provided for, as far as Columbus, pointing towards Wheeling. It is true that by continuing on some 66 or 70 miles further, and sweeping round further to the north, a terminus at Pittsburg could be reached; and should the Baltimore and Ohio railroad company make this their western terminus, such a connection would, at no very distant day, undoubtedly be formed. But what would be its effect on the business of the Baltimore and Ohio railroad, and on Baltimore itself? It would undoubtedly be to attract western and southwestern trade and travel to Pittsburg to be forwarded on in far greater proportions to Philadelphia, and not to Baltimore. Baltimore would no longer enjoy its present enviable position on the great thoroughfare of eastern and western travel and trade, nor would its proud work any longer serve as its favorite channel.

Were it conceded that no railroad connection between Pittsburg and Philadelphia could ever be formed, and were the Baltimore and

Ohio railroad company debarred, by any insuperable obstacle, from the selection of a more advantageous terminus for their great work, then, indeed, might it be expedient to form a connection with Pittsburg. But as the construction of a railroad from Pittsburg to Philadelphia may be considered certain, and that too at no distant day, especially if the trade and travel of the west be invited to the former city by making it the western terminus of the Baltimore and Ohio railroad, and, as another more eligible point for that terminus is accessible, as well from the west as from the east, it seems to me that no stockholder, I may say no Baltimorean, who will make himself acquainted with the subject, can for a moment hesitate in rejecting Pittsburg and selecting Wheeling as the western terminus of the Baltimore and Ohio railroad.

I am, sir, with great respect, your humble servant,  
ALFRED KELLEY.

Baltimore, July 5th, 1847.

HON. LOUIS McLANE:

Sir: I accidentally omitted, in my communication to you of the 2d inst., to remark upon the route of a railroad from Pittsburg west, through the counties of Columbiana, Stark and Wayne, etc., in Ohio. Such a route, in anything like a direct course, I consider impracticable. After leaving the northerly bend of the Ohio, say at or near the mouth of Little Beaver, it must pass through a country much broken by hills and valleys whose general direction, with few exceptions, crosses the track of a road running in an east and west direction. To obtain anything like a good line in this direction, it would be necessary to follow the valley of one of the forks of Little Beaver and of Sandy creek, to the Tuscarawas, in the westerly part of Stark county, or to swing round to the northern verge of this hilly country, near the south line of the Western Reserve, after leaving the valley of the Main or Northwestern Branch of Little Beaver. After reaching the Tuscarawas, it would also be found necessary to adopt a very crooked line, governed by the valleys of the streams, in order to reach Wooster in Wayne county. Between Wooster and Mansfield the country is also hilly—the hills extending generally in a direction from west of north to east of south, and, therefore, across the line of a road pursuing an easterly and westerly direction.

I feel confident that no favorable route for a railroad from Pittsburg to the central part of Ohio and Cincinnati can be found in this direction which will not be longer than the one suggested in my former communication, via the valleys of the Sandy Tuscarawas, thence along the valleys of the Toniaka and Leeking, or the Walkandy and Owl creek, to Mr. Vernon, thence southwest to Columbus. With all this region of country I am pretty well acquainted, having formerly explored it in reference to canal routes—and latterly lines have been run through the western portion of it with a view to discover the best railroad route from Cleveland to Columbus, the minutes of which I have seen and examined. I am, sir, very respectfully, your humble servant,  
ALFRED KELLEY.

**NOTICE TO CONTRACTORS.—ANDROS, COGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Railroad Office, in Lewiston, until the 17th of August next, inclusive, for the Grading and Masonry of the 2d Division of this Road, extending from Green to Belgrade, near Snow's Pond, about 20 miles.

Profiles will be ready for examination on and after the 10th of August, and all necessary information will be given, either at this office, or upon application to the resident engineers on the line of the road. Satisfactory bonds with sureties shall be given by the bidders, if required.

On the 16th of August, the Engineer will be prepared to accompany Contractors over the line of the road, commencing at the eastern end of the Division in Belgrade.

HOBERT CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.  
Railroad Office, Lewiston,  
July 13, 1847.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windorer, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron* only. Address  
SAM'L KIMBER & CO.,  
Willow Street Wharf,

We published, in No 30—July 24th—of the Journal, the Annual Report of this company, but omitted one of the most important and useful tables—that showing the number, condition and cost of repairs of, and miles run by, the Locomotive Engines belonging to the company. We now supply this omission.

GEORGIA RAILROAD AND BANKING COMPANY.

List of Locomotives in 1847.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advancements on consignments to their address.

July 31—3m

ROBERT GRACIE.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to  $\frac{1}{2}$  in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse 8. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

281f

**SPRING STEEL FOR LOCOMOTIVES,**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

1y

**A. & G. KALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons  $2\frac{1}{2}$  x  $\frac{1}{2}$  inch Flat Punched Rails, 20 ft. long. 25 "  $2\frac{1}{2}$  x  $\frac{1}{2}$  " " Flange Iron Rails. 75 " 1 x  $\frac{1}{2}$  " " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

111

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

26tf

**PATENT RAILROAD, SHIP AND BOAT**

Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v191y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Kenseleer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hineckly & Drury, Boston, will be promptly executed.

FRENCH & BAIRD.  
N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Meritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,324 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = \$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = 57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 331f

### LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

### RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Dec. 25, 1y\* Pres't. Mt. Savage Iron Works, Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
**EDMUND DRAPER,**  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

Road Depots, etc.

West Troy, May 13, 1847.

ANDREW MENEELY.

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
12cf Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,** Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by **JOHN W. LAWRENCE,** 142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 321y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope. INCH.	Weight per fathom. LBS. OZ.	Circumference of rope. INCH.	Weight per fathom. LBS. OZ.		Weight per fathom. LBS.	Diameter of iron. INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	9 3	8½	16 -		27	11-16	13½
14	3¼	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2¼	4 3	6	8 8		10½	7-16	7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24*

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

**THE SUBSCRIBERS, AGENTS FOR** the sale of

Codorus,  
Glendon,  
Spring Mill and  
Valley, } Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,**

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

**DAVIS, BROOKS & CO.,**

Jan. 2. [11c] 68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] **WILLIAM ROE, Sup't of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] **G. A. NICOLL,**

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] **T. L. SMITH,**

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] **JOHN LEACH,**

Jamaica November 12, 1845.

1y19 Sup't Motive Power

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for

some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

**G. A. NICOLLS,**  
ja45 Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**

ja45 N. E. cor. 15th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents,**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847. 10c

**RAILWAY IRON.—DAVIS, BROOKS** & Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 8 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 40c

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft, with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. ja45

**TO LOCOMOTIVE AND MARINE ENGINE** Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS**, War-house S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**PATENT INDESTRUCTIBLE WATER**

**Pipes.** The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 284f

J. BALL &amp; CO.

**CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.** On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7.11 1-4 a.m., and 2 1-2, 4 1-3, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON**, Agent.

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	1 00
" " " Xenia	1 50
" " " Springfield	2 00
" " " Columbus	4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 11 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47th W. H. CLEMENT, Sup't.

Decatur and Tuscumbia..... 22 00

The South Carolina Railroad Co. engage to re-

ceive merchandize consigned to their order, and to

forward the same to any point on their road; and to

the different stations on the Georgia and Western

and Atlantic railroad; and to Montgomery, Ala., by

the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

25

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to

Oothcaloga, a distance of 80 miles, and connects

daily (Sundays excepted) with the Georgia Rail-

road.

From Kingston, on this road, there is a tri-weekly

line of stages, which leave on the arrival of the cars

on Tuesday, Thursday and Saturday, for Warren-

ton, Huntsville, Decatur and Tuscumbia, Alabama,

and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga

for Chattanooga, Jasper, Murfreesborough, Knox-

ville and Nashville, Tennessee.

This is the most expeditious route from the east to

any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAIL-**

road line—direct. Via Newark, New Bruns-

wick, Princeton, Trenton,

and Bristol. (Through in

six hours.) Leaving New York daily from the foot

of Liberty street.

Morning line.....9 o'clock a.m.

Mail pilot line.....4 1/2 " p.m.

The lines proceed direct to Bristol without change

of cars, and thence by the new steamer, "John Ste-

vens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00

Second class cars..... 3 00

Passengers will procure their Tickets at the office

foot of Liberty st., where a commodious steamboat

will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each

passenger in this line, and passengers are expressly

prohibited from taking anything as baggage but

their wearing apparel, which will be at the risk of

the owner.

Philadelphia Baggage-crates are conveyed from

city to city, without being opened by the way. Each

train is provided with a car, in which are apart-

ments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the

foot of Walnut st. at 9 a.m. and 4 1/2 p.m.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### The Great Erie Railroad.

"This great work, we rejoice to hear, is progressing very rapidly. There are some 3000 men engaged on it, and it will probably be completed in the autumn of 1848. This road will open to settlement one of the finest portions of the State. Delaware county is full of rich valleys, and pierced with fine streams of water in every direction. The butter made in that county already rivals that of Orange county, and in ten years Delaware will be what Orange county is now—one of the most productive counties in the State.

"The 'mountain sides' of Delaware, are well adapted to grazing; and from that county we shall in a few years get most of our fine cattle for the New York market. When the road is finished, *Deltas* will be within ten hours' ride of New York; and we prophesy that provisions in New York will be more abundant and cheap in 1858 than they are now."

The editor of the *Times and Gazette* may well say that the butter made in Delaware county already rivals that of Orange—as it is well-known that "Orange county butter" is made in *nearly every county in the State!* even St. Lawrence sends more "Orange county butter" to market than old Orange herself—the *farms* being made by sample—and correspond to a T. The editor is also right in his estimate as to the abundance and price of provisions, as far as he goes; but he does not go far enough—the price of provisions will be materially reduced in

the New York market, for the reason that there will be *ten acres* within supplying distance of the city, where there is now *one*, and the population will not be doubled in ten years.

It will be a common thing to eat *butter and eggs* in New York for breakfast, which were fresh in the churn, and in the nest, the day before, in the neighborhood of *Binghamton and Owego!* and in less than 48 hours from lake Erie!! Such will be the case in three years, we hope.

### Cast Iron Bridges.

Failure of that over the Dee.

The recent lamentable accident caused by the failure of a girder to the railway bridge over the Dee, has created quite an excitement on the subject—and, even though we have frequently referred to it, we now make copious extracts from the evidence, which will be found on another page, given by able men who had examined the subject. The value of cast iron for bridges is not thoroughly understood—especially in this country—and as it is a matter of so much importance, we deem the space devoted to it well occupied.

### Coal Trade.

We have been furnished with the following statement of the coal sent to market by the Schuylkill canal—which we shall publish as furnished weekly.

SCHUYLKILL NAVIGATION.—Week ending August 17th, 1847.

	Tons. cwt.
Pottsville and Port Carbon.....	5,385 09
Schuylkill Haven.....	1,043 05
Port Clinton.....	70 00
This week.....	6,499 14
Previously.....	108,091 06
Total.....	114,591 00

### Cheshire Railroad.

We understand, says the *Keene Sentinel*, that the bonds issued by the Cheshire road, amounting to \$500,000, have all been taken at par. Over 80,000 was taken in this county, and more applied for, notwithstanding there is now owned in the county [the largest part in this village,] about \$275,000 in the stock, the assessments on which have all been paid. The road will be opened to Fitzwilliam early in September, and to our village before January, 1848.

We understand a locomotive has been put on the road this side of the Ashburnham summit, and the contractors are busy laying the rails between that point and Winchenden.

This is in accordance with the spirit evinced by the Cheshire delegates to the Boston convention several years since, at which we happened to be present, in relation to the extension of the Fitchburg railroad to Brattleboro'.

We perceive by the papers, says an exchange, that the stock of this road has advanced, within a few days, from 96 to \$1 31—and it will continue to advance, until it ranges with the best New England stocks.

### Delaware, Lehigh, Schuylkill, and Susquehanna Railroad.

We understand, from the *Gaston Whig*, that the stock of this road is taken up, and that the company is now in course of organization.

The object of this company is, we understand, to connect the coal and iron fields of Pennsylvania with Easton, and from thence by railroads over N. Jersey to New York bay.

A strong association of capitalists, embracing citizens of Pennsylvania, New Jersey, New York and Boston completed the subscription of stock on Monday last.

The gentlemen interested in the New Jersey, Delaware and Hudson railroad are prominent in this movement; and connecting links are now formed from the coal and iron fields of this State, through Easton, across New Jersey, to New Brunswick or vicinity, and from thence to the Hudson river opposite New York.

By this route, the coal and iron resources of the Lehigh and Little Schuylkill regions may reach the waters of New York bay, by as short a line of transportation as now exists or can be made to the tide waters of the Delaware river, from the Schuylkill regions. We congratulate our fellow citizens, says the *Whig*, on the prospect of this important avenue for their mineral riches.

This road has long been needed—but like many other important works, it has been delayed.

### Iron Tunnel.

We call attention to a letter, in another column, from Mr. Thomas Motley, C. E., on the subject of the projected iron tunnel over the Menni Straits.—Mr. Motley having taken the subject of cast iron girders for bridges into his serious consideration, since the fall of the Dee bridge on the Chester and Shrewsbury railway, his calculations on the strength of which appeared in the *Mining Journal* of the 12th June, has constructed a mechanical apparatus for testing the powers of all spans of great length, whether of cast or wrought iron. This was exhib-

ited in the Mechanical Section of the British Association, and gave great satisfaction. If Mr. Motley is right, and we have little doubt but that he is, Mr. Stephenson has not more than one-third the strength necessary to support the enormous weight that the construction of the bridge itself, with the passing trains, will impose upon it. We hope Mr. Stephenson and Mr. Hodgkinson will look to it: for if they persevere, and we have a second edition of the Dee bridge affair, their opinions will have but little weight afterwards, and it will bring into contempt the whole engineering talent of the country. —*Mining Journal.*

#### Telegraph.

In the House of Commons, on Thursday evening, Mr. Wakley presented a petition from Mr. S. Porter, claiming to have invented the electric telegraph in 1825, and communicated his discovery to the admiralty—he prayed inquiry into the subject.

**Improved Tubing.**—Our attention has been called to some important improvements recently made in the patent welded iron tubing, by Mr. Cornelius Whitehouse, of the Globe Tube Works, Wednesbury, the original patentee. These improvements, we are assured by a friend who has had much practical experience, places Mr. Whitehouse's manufacture at the head of all inventions of a like character. For the electric telegraph this tubing is peculiarly applicable. —*Railway Record.*

#### Madison and Indianapolis Road.

"The iron rails are laid upon our road," says the Sentinel, "to within 13 miles of Indianapolis, and it is confidently stated that the cars will be whirling into town by the 15th of August."

We are gratified to chronicle the event—as this company have done nobly, in pressing on their work against the difficulties they had to overcome.

#### Providence and Worcester Road.

The Worcester Spy says that "the directors of this road have located their freight depot on Green street, directly south of the Western railroad track, and the two dwelling houses now standing on the premises have been sold, to be removed.

"The engine house and car house of the company on Southbridge street, are going forward rapidly, under the supervision of Tower and Raymond, the efficient contractors. The car house is of wood, 200 feet in length by 34 wide. It was commenced on the 5th of July, and is now enclosed, and the roof covered and shingled. The doors at the ends of the building weigh 1400 pounds each, and will slide up and down, being balanced by weights. The engine house is a very substantial edifice, 90 feet long by 48 wide, with walls 16 inches thick built throughout of the best hard burned brick. Though not put under contract till the 9th or 10th of July, the walls are now ready to receive the roof.

"The rails are now laid on this end of the route, nearly to Farnumville, or about ten miles. We supposed the work is further advanced at the other end. A strong force is at work at the hard cutting on section 20, this side of Millville, and it is in such a state of forwardness that confident calculations are made, if nothing unforeseen should happen to prevent, that the whole line of the road, through to Providence, may be opened for travel by the first of next month."

Such is the progress of a work along the margin of—or not far from—a canal, in this country; and we expect soon to hear a similar report in relation to the railroad from Worcester to Nashua, in N. H.—thus making Worcester almost as much of a railroad focus as Boston. Who will contemplate the rapid extension of the railroad system in New England, and the constantly increasing dividends paid to the stockholders, and hesitate to believe that they contribute largely to the general, as well as to individual, prosperity?

#### Black Stone Canal.

This is to the point—after having written the above in relation to the Providence and Worcester railroad, the annexed article, from the Worcester Palladium presented itself to our notice, and we of course put it upon record for future reference.

"We picked up an old paper the other day," says the Palladium of 4th August, "in which was the following, which purported to have been copied from the Massachusetts Spy of October 8th, 1828.

"MARINE NEWS.  
Port of Worcester, Oct. 8, 1828.

"Arrived yesterday, canal boat Lady Carrington, Capt. Dobson, from Providence, with salt and corn, to Nathan Hurd."

"We understand this to have been the first boat that made a trip on the Blackstone canal from Providence to Worcester. And so important was the canal regarded, that when President Jackson put his celebrated veto on the Maysville road, there was a bill on the table of the House, waiting its turn among a host of others, whose aggregate was not less than one hundred million of dollars, appropriating one hundred thousand dollars in aid of the Blackstone canal company.

"Twenty years have not passed by; the canal, superseded by a better mode of conveyance, has been abandoned by its proprietor, or sold at so low a rate as to amount to an abandonment: and the people themselves have nearly completed a substantial railway between the two places, with their own means, and without aid from the government.—Truly this is a world of change; not the least of which is in man's views of public policy."

Such have been the changes of the past twenty years; who dare predict the changes to be produced within an equal period to come?

#### Railroad Matters in Massachusetts. Norfolk County Railroad.

The Boston Post says that "the Walpole railroad company, incorporated in 1846, to build a road from Dedham to Walpole, and the Norfolk county railroad company, incorporated at the last session of the legislature, to continue the road from Walpole to the valley of the Blackstone, have, in pursuance of the provisions of the act of last winter, united themselves in one joint stock company.

"This road, it will be remembered, was chartered by the last legislature in opposition to the claims of the so-called 'air-line' routes and 'central' routes, the committees and the legislature being convinced that it was the true route by which to divide the triangle formed by the Boston and Providence, Boston and Worcester and Providence and Worcester railroads. It also accommodates the county travel for Norfolk county to its shire-town, Dedham, while it opens the rich valley of the Blackstone to the Boston market, bringing Blackstone, Woonsocket, Slatersville, Uxbridge, and the adjacent large towns, within 70 minutes' ride of this city. We are informed that the subscription books have already been in the hands of the farming interest along the line of the road, who have subscribed liberally. The books will soon be submitted to capitalists, who will lose no time in giving their aid to the remaining route, which thus completes the circle of roads diverging in all directions from this common centre. The statistics submitted to the legislature abundantly proved that the road will be a highly profitable one, and if the statistics had not been made public, still the money, time and labor spent by the rival claimants for building a road over this section of the country last winter, would convince any one that all are convinced of the value of a charter to the successful applicants."

And the Traveller, of 24th July, say: "In connection with the above, it may be well to state that the branch railroad is nearly completed from Dorchester and Milton Upper Mills, passing down through the Lower Mills villages to the mouth of the Neponset river, thence to intersect the Old Colony railroad—known as the 'Dorchester and Milton Branch Railroad.' The terminus of this branch is but about two miles from the contemplated junction of the Norfolk county and the Walpole railroads with the Providence railroad; and it will be seen, therefore, that by building only about two miles, to wit, from the terminus of the Dorchester and Milton branch to the Providence railroad, an unbroken chain of communication will be opened between the Providence railroad and all its branches; the Norfolk co. and Walpole, and the Old Colony and Fall River railroads, and all their branches, with a direct route to Neponset; thereby giving these roads all the facilities of a terminus upon navigable waters, where vessels of any size can come up to the very railroad itself, without a single bridge or obstruction of any sort. This must be a desideratum to the Providence railroad and its tributaries, located as its depot is, in Boston. We hope one day, and that not far off, to see this arrangement take place, and we believe the interests of all the parties concerned will prompt them to its completion.

"Passing along the line of the Dorchester and Milton branch, a few days ago, we were pleased to find it so far advanced, and were informed that the cars would probably run in October next.

"This branch runs near all the manufactories of Dorchester and Milton, and will embrace, we should think, (in connection with the freight on the line,) population enough to render it a profitable investment of itself, without reference to the incalculable benefits which would accrue to it from a union with the railroads above mentioned."

Thus we find the people of the towns and villages on every side of Boston, engaged in the construction of branches and connections between the numerous main lines of railroad, which radiate from the common centre. The extent to which this enterprize will be carried in New England is yet but little dreamed of.

#### Western and Atlantic Railroad, Georgia.

There was, some time since, published in the Augusta (Ga.) Chronicle, the following article—and we believe several others from the same pen—urging the importance of the early completion, by the State, of this road to the Tennessee river at Chattanooga. The writer is evidently well acquainted with the county, its resources, and its rivers, and he brings the subject fairly and fully before the people of Georgia, and we trust that they will not hesitate in the matter, but rather promptly adopt the necessary measures, to ensure the completion of the work at the earliest period.

We consider this as one of the natural outlets of the rich valley of the Ohio and Mississippi, and their numerous tributaries, to the Atlantic; and the people of Georgia and South Carolina are entitled to great credit for their efforts—and their success thus far—in opening the way; a little effort more is only necessary to accomplish the object—and that effort, we are sure, will be made.

**MESSENGERS EDITORS:** As the extension of the Western and Atlantic railroad to its terminus at Chattanooga, at the earliest possible day, is of the greatest importance to the ultimate success of that great work, and to the whole people of Georgia, allow me to submit thro'

your paper a few facts in reference to the country that must and will become tributary to that road, and to the commerce of our cities, to which I desire to invite the calm and dispassionate investigation of the intelligent and reflecting of all classes. To illustrate more clearly the correctness of my position, the reader must be referred to the above sketch of the map of the entire country which will seek this channel to convey its immense products of cotton, corn, flour, bacon, wheat and other provisions to market, so soon as the road is completed to Chattanooga.

The road is already completed to Cross Plains, in Murray county, and it is graded from that point to Chattanooga (except a tunnel of twelve hundred feet in length) a distance of thirty-five miles. To complete the road to its terminus at Chattanooga, it is estimated by competent engineers, will require an additional expenditure by the State, of only three hundred and seventy-five thousand dollars! This done, and it only requires a glance at the sketch of the country around Chattanooga, to satisfy the most skeptical, that the road will bring from Tennessee and Alabama, four-fold more produce than from all the depots now on the road, including Cross Plains. To establish this position, I must introduce a few facts in reference to the navigation of the rivers laid down in the sketch, all of which have been obtained from a gentleman of high character and unquestionable veracity, who has been extensively engaged in the navigation of those streams for several years.

The "Tennessee River" is navigable for steamboats of heavy burden down to Decatur in Alabama, 160 miles from Chattanooga, eight months, and for light boats all the year. There are no dangers in the navigation of this river, between these points—shown by twenty years experience, as not a steamer has been lost or materially injured during this time. The obstacles are the "Suck," and "Boiling Pot"—at one of these places only, do obstacles exist, at the same time. The "Suck" is rapid at low, but not so at high water. The "Pot" is rapid at high, but not so at low water. Both are straight and deep currents. To pass either, in ascending these rapids, boats have to be aided by a cable, causing half to two hours delay. On the river above Decatur, there are 45,000 to 50,000 bales of cotton annually made.

Steamboats can reach Elton, in Gibbs county, on "Elk River," 60 miles, six months in the year, where there are 20,000 bales of cotton yearly grown. This amount of cotton, with the other agricultural productions, will equal in quantity, and perhaps in value, the quantity of cotton on the "Tennessee River"—all of which has heretofore been obliged to pass the shoals, to find a market in New Orleans. The mouth of the "Elk" is fifteen miles below Decatur, where the obstructions commence. The time of shipments for this rich section of country, to return sales, has varied from two to five months, according to mode of conveyance, and stage of water. Shoal tides occur two, three or four times a year, and the shipments made from above

these almost impassable shoals, have often to wait long for a rise in the river. There are at this time on the river above the "Muscel Shoals," four steamboats, of capacity to take to and from Chattanooga, all the cotton and produce that may offer for our markets the coming season.

From Chattanooga to Knoxville, on the "Holston River," is two hundred miles, navigable for large boats six months, and for small boats all the year—barges and small boats come down the Holston 250 miles above Knoxville, and 450 to Chattanooga.

The "French Broad" is navigable fifty miles for small steamers, and a hundred for barges and flat boats.

"Little Tennessee" and "Hiwassee" are each navigable for small steamers, 50 miles, and barges 70 to 100 miles.

As yet, the "Clinch River" has not been navigable for steamboats, but barges and flat boats have been used for many years, 200 to 250 miles.

"Nolechucky" has a flat boat navigation, 75 miles. "Big pigeon" and "Emory" rivers have also navigation for short distances.

This, sir, is an array of facts as imposing as they are conclusive and satisfactory in illustrating the importance, to every tax payer of Georgia, of completing the Western and Atlantic railroad to Chattanooga. Need I enlarge upon these facts? Need I enter into an estimate of the vast productions of that extensive region of country through which all these rivers flow, all of which must seek a market over this road, as soon as it is completed to Chattanooga? I think not; it would be equally a trespass upon your space, and an insult to the intelligence of the people of Georgia. Great as the productions of that vast region of country already are, all experience teaches, that the facilities which such a communication as this road will afford will increase them beyond all reasonable calculation.

What then should Georgia do in reference to the extension of this road? or rather, what will she not do to accomplish so great an enterprise? Am I too sanguine in anticipating that the whole people of Georgia will unite in saying to their legislators at the ensuing session, "You must avail yourselves of any and all the means which the State can command to extend this road?" I think not, and I therefore commit the subject to their consideration and keeping, with the single remark that I have no interest in any road or other improvement in Georgia or elsewhere which may be benefited by this work. A native of Georgia, I desire to see her prosper, and marching on with a firm and steady step to that high destiny which her position, immense resources and the intelligence and enterprise of her citizens should secure for her. These are my feelings and these the influences which operate on

GEORGIA.

#### Railroad Fares.

##### Effect on Trade, Real Estate, Rents and Labor.

We copy the following short article on the influences of high and low fares on cities, from the Charleston Mercury; and we agree fully with "Citizen," that there is a way in which fares may be reduced, and rents, and value of property raised, and all parties benefited—and we agree with him as to the way of producing such a result, viz: "let the property holders in cities be taxed" to aid in the construction of branches to, or even for main roads terminating in such cities—and thus aid in drawing business to its stores and wharves, and then of course rents will increase, property will advance, and fares—from the increase of business on the railroads—will of course be reduced.

Such are the influences of long lines of railroads upon cities in which they terminate, that the city of New York, for instance, cannot afford to do without them. We hazard little in saying that that city would, at this day, be worth more than it now is, if it had been taxed—during the past ten years—a million of dollars annually for the construction of the New York and Erie railroad. Indeed one-half that amount would have been saved annually in the cost of living alone; and the rise in the value of property, on the completion of the road, would have been double the entire cost of the work. These facts will be learned after a while—but even then there are those who will resist such a course, because they hope that the same results will be produced by individual efforts, and they derive the advantage without contributing to the result. Such men are to be found in every community. The writer in the Mercury says:

"Free Trade" complains that the city property is not enhanced in value, and attributes it to the high fares on the railroad. There is an error in this, and the error is the more likely to escape detection inasmuch as "Free Trade" has a great truth at the bottom of his proposition, but he applies it without considering all the parties and interests involved. It is very true that lower fares might and most probably would induce more travel and indeed more trade to come to Charleston, and consequently enhance the value of property, and the rise of rents; but in doing this, who is the loser and who is the gainer? The railroad stockholder has reduced his fares as low as a regard to the value of his stock will allow; reduce the fares below what gives him a fair dividend, and you destroy the value of his property to enhance the value of other property.

But is there no means of reconciling in practice both interests? There is. Let the city aid the railroads which are being built to fall in upon our railroad, and the increase of traffic and travel that will be produced by them, will enable our road to reduce its rates, and thus all who trade with us, and both road and city, will be benefited. Let the property holders consent to be lightly taxed for a short time, and instruct the city council to subscribe to the Greenville road, the Charlotte road, and the Nashville road, and we venture the prediction, that while the stock will repay the outlay, these roads will bring a trade and business to the city which will enable our road to reduce its rates one-half, and raise the value of real estate and rents to double their present range.

Does "Free Trade" mean to imply that the establishment of our railroad has caused a decline in the value of real estate and rents in Charleston? If so, we deem it a sad mistake. If rents and real estate have fallen, the cause lies in other sources. Federal legislation gave us the fatal blow, and we are now only recovering as it retracts its unwise and unjust measures. As a fact of general application, we do not think the value of real estate and rents have receded in the period he fixes; exceptions in particular localities may be found, where property has fallen and rents diminished. The localities of trade and business change frequently, as fashion or channels on which it comes to a city change.—These changes, however, do not prove that the city has lost trade, or its real estate and rents have been depreciated, except in the parts deserted. One locality loses, another gains; this cannot be helped. But on the whole, who thinks Charleston has lost trade by her railroads? Look at her increased exports; at her vastly increased trade with Georgia, Alabama and Tennessee! What do we attribute it to but the railroad? would all this have come, but for the railroad?—And without it, would not real estate and rents and labor be lower than they are?

CITIZEN.

#### Wilmington Connection Railroad.

By the following proceedings of a meeting held at Wilmington, N. C., on the 29th July, we are led to hope that this work will be commenced at an early day. It becomes daily of deeper interest to the travelling and business community, that the link to the great chain should be supplied without further delay. Its importance is to the north—especially the northern cities—as well as to the south; and we hope to learn that the able president, Ex-Governor DUDLEY, of North Carolina, who is now on a visit north, for the purpose of negotiating for iron, and to interest our northern friends in the work, has been eminently successful.

The proceedings of the meeting are taken from the Wilmington Commercial, of 3d August, and are as follows, viz:

The adjourned meeting of the citizens of Wilmington, was held at Masonic Hall to receive the report of the committee of twelve appointed at the meeting on Monday, 26th.

The committee made a partial verbal report, (not having been able to discharge their duties fully,) stating that the increased subscriptions in the last two days had been about \$50,000, and from the sources still to be relied on, there can no longer be a rational doubt, that Wilmington will fully come up to the mark, and do all that has been expected from her.

They further reported that, from a careful investigation of the subject, having access to estimates, etc., it must be a paying stock, the lowest estimate being seven to eight per cent.

On motion of O. G. Parsley, it was

Resolved, That the thanks of the meeting be tendered to the committee, and that they be requested to prosecute their duties until finished. On motion of R. P. Bradley,

Resolved, That to insure the building of the road, \$300,000 must be subscribed by the citizens of this place.

Resolved, That it can, and shall be done, by the 1st day of November! Unanimously adopted.

The meeting was then earnestly addressed by Governor Dudley, Mr. Gregg, of South Carolina, Messrs. O. G. Parsley, D. Fulton, R. Bradley, T. W. Brown, W. O. Jeffreys and the chairman.

It was further

Resolved, That a committee of six be appointed by the chairman to procure subscriptions on the line of the old road.

The meeting then adjourned to meet on Monday, 9th of August.

JOHN McRAE, Chairman.

R. G. RANKIN, Secretary.

Since the above was in type, we have received the Engineer's Report—to which we shall refer hereafter.

#### Buffalo and Mississippi Railroad.

We find the following remarks in the St. Josephs (Ind.) Register, in relation to the proposed railroad from the Lakes to Chicago. The editor says:

"The proposed union of the Buffalo and Mississippi railroad with the Southern Michigan railroad, (already completed from lake Erie hitherward 68 miles) has materially brightened the prospects for the speedy completion of the line, and encouraged those who have been the early and zealous advocates of this route to more substantial action. There appears to be no doubt but that if the necessary amount of stock for grading and laying the superstructure of the road is taken by our citizens and paid in labor or materials, that capitalists from the east will be ready to go on and complete it, and while there is every evidence that La Grange and Elkhart counties will as soon as the busy work of harvest is over, take hold and subscribe the amount, we have an abiding confidence that this county will at that time also, prove herself not behind her neighbors in this great work, so vitally important to us. The whole county should be canvassed for subscriptions, and when the benefits of the road are fully explained, there will be no backwardness on the part of our farmers towards lending their influence and means to its completion.

"On our recent visit to Chicago we found, in conversation with many of the business men of that city, that they confidently expected to have the cars of the Central railroad in their streets within two years. We took occasion, whenever this was mentioned, to show to them that the Central railroad could not and would not obtain the right of way through Indiana—that an overwhelming majority of the citizens of northern Indiana are determined not to follow Esau's example and sell their birthright for a mess of pottage, and that if Chicago wanted a railroad to connect herself with lake Erie, the only way she could obtain it was to extend assistance to the direct route of which we have been speaking in this article. We noticed, or thought we did at any rate, that the most of those with whom we conversed really preferred the direct route, if it could be built.

"On this right of way question we are glad that there is but one opinion among all parties in this county. Both of the promi-

nent candidates for representative are open and firm in their opposition to granting it, as long as there is any probability of the direct route being completed, and this same feeling is the only one in Elkhart and La Grange. We believe, also, that we can rely on some help even from the counties west of this.—Let us be firm and unyielding, and our object will finally be accomplished."

It is possible that this question of "right of way" may be definitely settled; but we can hardly think an enlightened people will resist the extension of the Central Michigan road to Chicago.

#### Railway Casualty Compensation Assurance Company.

We find the following proposition for compensation for—or assurance against—casualties on railroads, in Herapath's Journal for 17th July. The suggestion is a good one, and its consideration and adoption in this country would provide for the families of those engaged on our numerous railroads, who may meet with accident.

MR. EDITOR: I have the honor to submit to your attention the preliminary prospectus of an Assurance Company, having for its object the payment of a fixed sum to the assured for injuries sustained from railway accidents, or to their representatives, in case of death resulting from railway travelling.

In the course of a few days, a select committee of management will be appointed, when a public meeting will be duly convened, and the project duly advertised. Meantime, I would beg leave to state for your editorial notice, in what manner the scheme originated, and on what ground it is intended to be submitted to the public.

For some years past, the subject has occupied my attention, but as I had confident hopes that the safer system of atmospheric traction would supersede the locomotive system, the project was allowed to lie dormant; and I now revive it, seeing that the atmospheric system has been abandoned by the railway company to whom that great experiment was entrusted by parliament.

From the calculations I have made, and from numerous fearful casualties that have lately occurred, I am firmly persuaded of its necessity as regards the public interests, and of its soundness as a commercial speculation. You will observe that the principle upon which premiums on life policies are calculated, will not apply to the case here; the premiums on casualty policies are therefore to be paid but once, and not annually, as charged for by life and other assurance offices; and the contingencies being so remote, the premiums are fixed at a proportionately low rate, being based on the actual number of injuries sustained annually by the public, and upon the comparative risks incurred by, and responsibility attached to each class of railway servants.

The project has met with very flattering approval in many quarters, and I have every reason to believe that most of the leading railway companies would find it to their interests at once to adopt it, as a certain means of providing compensation for casualties sustained by their own servants; but, inasmuch as the measure of public confidence accorde

to such an institution will mainly depend on the high and independent position of the directors to be appointed, I have ventured, before issuing any public advertisements, to submit the proposition to a select few, and especially to you, in the hope that they and you will see fit, on public grounds, to express a favorable opinion of the project.

It is proposed, that the subscriptions paid by the assured, shall be carried to a "Reserved Fund," which shall be kept totally distinct from the share capital of the company.

The tables of premiums are calculated at a rate to bring them within the means of all classes of railway travellers, and the statistics upon which these are founded, have led to the conclusion, that the "Reserved Fund" would probably amount to two millions of money, paid up by half a million of subscribers within the first two years.

Of this estimated half million of subscribers, it has been ascertained that the "Commercial Travellers," as a body, would influence 70,000 subscribers, and that the "Engine Driver's Association" would influence 30,000 more, including every class of railway servants.

It is, perhaps, necessary, that I should here direct your attention to the only argument hitherto urged against the proposition, viz: that the public will not take it up, because it is supposed that less accidents occur now by railway, than formerly by stage coach travelling, taking mile for mile and passenger for passenger.

This argument is founded on a popular error. There is no data for it in existence; and, were there any, no average could possibly be worth anything, unless it included the number of passengers, and the mileage travelled by other modes of conveyance over all kinds of public roads, (including high roads, turnpikes, cross roads, etc.) all of which are now practically superseded by railroads.

The average number of railway casualties are reported officially to be equal to 1 per annum to every 10½ miles of railway.

There is no means of ascertaining the proportion of casualties under the old system of travelling; it is, therefore, contended that a mere comparison between the number of miles travelled, and the number of passengers carried by stage coaches and by railway would afford a very inaccurate test of the relative risks encountered by the public under either system.

There is no fair analogy to be drawn between two systems so utterly different as regards speed, etc.; but were it even possible to make a correct comparison of the dangers to which a given number of trains, and all other public conveyances are subjected, it is very questionable whether that comparison would give a result in favor of the argument used against the proposition now submitted to you.

At the present moment, to say nothing of the future, there are as many, if not more, distinct trains running at the same time between any two given places, on any day, as there were formerly stage coaches, each train carrying eighty passengers on an average, or

five times the full complement of a stage coach.

There being, then, five times as many travellers now as formerly, the risks run by the public are proportionately increased, above and beyond the relative dangers inseparable from either system.

This I assume to be a fair argument in favor of the assurance company; in addition to which there is another far more important consideration, namely, that such a public institution would be the means of exercising a most wholesome and vigilant control over all railway mismanagement.

The public should support the proposed company, because it will tend to insure, to the greatest extent, safety in railway travelling. The Compensation Assurance Company will operate as a constant guard and check upon the railway companies; the shareholders will be always upon the lookout for danger—always prompt to point out any practice inconsistent with safety, and to denounce any management where proper means are not adopted for the protection of the public, and they will be astute to punish negligence or want of proper attention.

The railway interest should also support the company, because anything which tends to the general safety of railway travelling tends directly to the increase of railway receipts. The proposition to insure railway servants should be popular with railway directors, as it would relieve them from a very painful consideration in the event of an accident to a servant; the knowledge that his family, during his sickness, or after his death, would have some adequate relief and compensation would greatly relieve the direction from a most painful responsibility.

The near approach of the half-yearly meetings of all railway companies, offers a fit opportunity for bringing the project under the special notice of the different proprietaries; it is therefore hoped that the respective chairmen of the leading metropolitan railway companies will not fail to recommend it to the general adoption of railway companies, as a certain means of providing compensation for any injuries sustained by their own servants while employed in the discharge of their several duties.

It is upon these grounds that I have the honor to claim your attention to the project, being, as I have before stated, firmly persuaded of its necessity as regards the public interests, and of its soundness as a commercial speculation.

#### Railroads at the South.

The following extract from a letter of a highly intelligent merchant, now in Boston, says the Charleston Mercury, has been handed to us for publication.

"I cannot but feel a deep interest in the discussions that are now going on relative to the various lines of railroads—about those in Alabama, Tennessee, etc.; there can be no mistake that they all tend to increase the trade and commerce of Charleston, there can be no difference of opinion about the Greenville and Charleston roads; by the way, it seems to me that the plan pursued by the ci-

tizens of Nashville is the true one; as all are interested, so all contribute and participate in the profit or loss. I am willing to have the city go in strong for what is without doubt to benefit her; but I look upon the plan of connecting the Wilmington road with the South Carolina road, about *Manchester*, or the continuing the roads from Raleigh, through Fayetteville and Cheraw, to Camden, as both of them very injurious to the interest of Charleston, and schemes in which her citizens cannot be expected to participate. That there will be a railroad communication in place of the present steamboats between Wilmington and Charleston, I entertain not a doubt. The bulk of the travelling community are not satisfied with the present mode, nor with steamships to New York, and will not be contented till they get a railroad. Now the only railroad that we can go for, and this I think we ought to encourage, is to connect Charleston and Wilmington by the way of Georgetown, etc. I am aware that throughout the interior they are in favor of the *upper*, or what is termed the *Metropolitan* route, and many say that will be built anyhow, whether the lower route is or not. It may be so, but when built, it kills the Wilmington road, and takes away a great deal of trade from Charleston. In the general scramble that is going on, we must try and look out sharp for ourselves."

#### Central (Ohio) Railroad.

Pursuant to notice generally given, says the Zanesville Courier, of 29th July, the books for subscription to the capital stock of the "Central, Ohio, Railroad Company," are opened to day, at places designated, in the three towns of Columbus, Newark and Zanesville. The books for this place may be found at the county auditor's office, and are under the supervision of Messrs. Convers, Sturges Mitchell, Raguet and Brush, or three of them.

The object of the present subscription, as set forth in the advertisement, is the organization of the company. It is absolutely necessary for our citizens to put down such an amount as will secure to them a proper representation in the directory to be elected.—And it is almost equally essential that such a further amount should be set down as will be an earnest of our intention to build, at least, such portion of the road as will be of most advantage to our community, and of most speedy profit to the stockholders.

We are led to speak of these things, from our knowledge of the fact that our friends in Columbus and Newark, particularly the latter, intend to make handsome subscriptions, and we should regret to see the efforts of our own citizens eclipsed.

Too much has been already said and done to leave any necessity for arguments from us or others, to prove the innumerable benefits to our town and county, which must result from railroad connections. The people, we are glad to believe, are wide awake on this subject, for they have examined it for themselves, and neither elaborate arguments nor additional facts, are needed to convince them, when they are already satisfied. Fully alive to the

importance of railroads, anxious to see them not only projected, but in operation, so as to give them an iron grasp upon the resources and business of by far the larger part of central Ohio, it behooves them to look to it, that what they hope for shall be secured. This can be accomplished if they would only undertake to help themselves. Calling upon this, or that, particular class of people, never effected anything yet, and will effect nothing now. This road is to be built by men of moderate means, business men of ordinary ability, and not by capitalists. Depend wholly upon the latter, fellow citizens, and, for twenty years at least to come, you may whistle for your railroads—no locomotive will do it for you.

Let us have, then, a good subscription today and to-morrow; let each man fix his mark, and come up to it without loss of time. There is not a bit of fear that too much will be subscribed, and there is no good reason for holding back on that account. Walk up to the book, friends, put down your names for as much as you can muster, and, as a loan to yourselves, you will find, our word for it, that it will be the best loan you ever made.

The remarks of the editor of the *Courier* are in the right spirit. It is not upon capitalists, but upon the middling interest, that we must rely for subscriptions to railroads. It was not the rich men—as a body—but the business men of Boston and Massachusetts, who built her railroads, and so must it be in Ohio and elsewhere.

#### Erie Canal at Buffalo.

We find the following article in the *Buffalo Courier*. It indicates a disposition to adopt measures which shall provide better accommodation for the business of the lake and canal at Buffalo—and we hope that it will be promptly commenced, and completed at the earliest possible period.

#### The Canal, the Harbor, the Canal Board.

—The examinations made by several members of the canal board, at this point, have convinced them of the necessity of providing more room for the accommodation of the lake commerce. The increase of business this season, at this point, over last, is truly astonishing. The amount of tolls received at Buffalo, from the opening of navigation to the 22d July, is as follows:

1847.....	\$648,819 05
1846.....	357,507 68
Increase.....	\$291,111 37

The increase for the third week in July has been large, which shows that the augmentation will continue through the season. The following shows the increase at Buffalo, Rochester and Oswego:

	1847.	1846.	Increase.
Buffalo....	\$57,760 92	\$21,784 93	\$35,975 99
Rochester..	6,923 23	4,464 38	2,458 85
Oswego.....	9,759 79	7,376 23	2,384 56

While the increase at Buffalo has been 164 per cent., at Rochester it has been only about 33½, and at Oswego only about 28½. These facts go to show clearly and conclusively that we must have more harbor room and more canal facilities.

The comptroller, Mr. Flagg, has come to the conclusion, we understand, that something must be done, and that as speedily as possi-

ble, to obviate the difficulties which now interpose to the facile transaction of business at this point.

The following general plan was submitted to the council, at a special meeting held recently, by the mayor, addressed to the canal board, and adopted by the council:

#### To the Canal Board of the State of New York:

The common council of the city of Buffalo submit for your consideration, the following general plan for the enlargement of Buffalo harbor, and the Erie canal, with the view of increasing the facilities for the transportation of property at this port.

1. Taking off the elbow and the widening the creek in addition to its present width as far up as it is practicable—say 200 to 300 ft. in width.

2. A ship canal from near the mouth of the Buffalo creek, parallel with the Erie canal, 30 feet wide, or of sufficient width and capacity to pass a volume of water large enough to supply Black Rock harbor and the Erie canal east of that place.

The removal of the traverse pier, or upper section of the Black Rock dam, and so far modifying the pier as to connect it with the main shore below Sandytown point, leaving the channel of Niagara river between Bird Island and the American shore, open and unmolested, as it was originally.

The construction of a wall, or breakwater, from the mouth of the Buffalo creek as far out as the original bank of the river, to Black Rock, to prevent the further encroachment of the lake towards the canal.

3. A ship canal and slips in the peninsula between the lake and Buffalo creek.

4. The excavation of the Hamburg St. basin, with one or more cross slips from thence to the upper part of the harbor.

5. The opening of the south channel from the upper part of the present harbor to lake Erie, and asking general government to construct the necessary pier to protect the entrance thereto.

6. The construction of a sea wall, or some other suitable work, to four mile point, to prevent the further encroachment of the lake and the flooding of the flat lands in that direction.

The foregoing general plan contemplates an inside work, which when completed, will extend from the toll bridge to lower Black Rock, a distance of four miles.

In executing the plan, it is believed that the state and national government can co-operate with the city, and, although it may require years to complete the work, yet, if commenced, and steadily prosecuted, each year will add to our commercial facilities, and when completed it will form a capacious inner harbor, well adapted for the transshipment of the immense commerce of the lakes and canal.

It encircles that portion of the city which is bounded by water, and has a strong tendency to unite the several interests of our citizens, and at the same time will meet the public demands for an increase of room, better than any other plan which has been proposed

and at less expense. It is all contiguous to the Erie canal, and may be regarded as an extended basin, for the mutual accommodation of canal boats and the lake shipping.

#### DEE BRIDGE FAILURE.

"Considerable interest has been caused among the profession through the failure of a cast iron girder bridge over the River Dee, near Chester, which took place on the 24th May last; and in consequence of the accident involving the death of some individuals, a coroner's inquest has been held, which lasted several days. It is not our intention to give the whole of the evidence, as much of it was extraneous: but we shall select those portions which immediately apply to the construction and failure, and then offer some remarks of our own, together with a wood engraving of the girder, showing the fracture and a section.\*"

Mr. Thomas Alfred Yarrow, who was selected by the coroner and jury to examine the bridge, said—I have been a civil engineer for the last 12 years. I have held the appointment of bridge master for Chester for some time, and have no connection at present with any railway. I have made an examination of the railway bridge over the Dee, and I now read my report of the inspection.

*Report.*—"Upon examining the bridge, I found that the masonry and iron work, with the exception of that part of each which had fallen, were in an apparently sound state.—The principle of the bridge is that of trussed girders of cast metal resting upon stone piers and abutments, which are parallel to the course of the river, but askew to the railway above. Each girder consists of three pieces, having vertical flanges, with bolts at the joints, and in addition to being bolted to the full depth of the girder, each joint is surmounted by a segmental piece, to receive which, notches have been cast in the upper surface of the girders. The tension rods descend in an oblique direction to each joint, and are carried horizontally between them; they consist of separate bars of wrought iron, which are secured to each other laterally by clips. The portion of the bridge which has fallen consists of one outside girder on the Saltney side of the river, with the attached platform and transverse tension rods. Two stones, composing part of the string course, and acting as a bed for the girder on the Saltney abutment have fallen, and also the corner stone at the acute angle of the opposite river pier upon which the broken girder rested. The girder itself is broken, having two fractures in the length near to the Saltney abutment, and one in its centre.

"Having premised this short description of construction of the bridge, and its present appearance, I may proceed to detail the facts which I have remarked during my investigation, and which have enabled me to arrive at a confident conclusion as to the cause of the accident. My attention was in the first instance directed to an examination of the frac-

\* We merely give the evidence as published in the *Civil Engineer & Architects Journal*—omitting the editor's remarks and engraving.

tured ends of the girder, for the purpose of ascertaining whether any defect had existed in the castings. The appearance of the broken surface led me to conclude that the castings had been sound, and the tension bars, as far as they have yet been recovered from the water, are unbroken.

"From calculations which I have made of the strength of the girders, taken from an actual measurement of the section at the point of fracture, I find that, independent of any additional strength that may be obtained from the tension bars, the girders alone are capable of sustaining a much greater weight than could under any ordinary circumstances be placed upon them. The breaking weight of each girder I calculate at 74 tons, supposing the weight to be concentrated over one point, and of both girders 148 tons. But it is an admitted principle that a beam will carry twice the weight, distributed over its whole surface, that it will bear upon one point.—We can therefore conclude, that twice the above weight,  $148 \times 2 = 296$  tons, is the breaking weight of one bay or opening of the bridge for one line of rails. The weight of girders and platform is, at a rough calculation, about 90 tons, which must be deducted from the foregoing quantity; we have therefore 296, less 90, equal 206 tons as the breaking weight; and this is altogether without reference to the tension bars.

"From the above facts, I concluded that the accident did not arise from the breaking of the girder as a primary cause, and I therefore directed my attention to the state of the masonry, and to a consideration of its sustaining power. Having carefully examined all the displaced stone and their respective beds, I found that one, previously named as forming the acute angle of the river pier, and upon which one end of the broken girder rested, was totally inadequate, in its form and bearing surface, to its important situation.—This stone had sustained nearly three-quarters of that portion of the flange of the girder which rested upon the pier. The area of its lower surface is 24ft. 6in., of which 11ft. 6in. only was bedded on the pier, leaving 13ft. to overhang as a cornice. The stone was not connected by cramps or ties with the adjoining masonry of the pier. The railway over the whole bridge is curved. The broken girder supporting the outer side, and being subject to a greater lateral force than the girders forming the inside radius of the curve, I consider that this lateral force, acting during the passage of each train, must have so far loosened the inefficient masonry, as to cause a displacement of the girder itself and its consequent fracture."

Mr. Robert Board, superintendent of the Mauseley Iron Works.—The girders of the Chester railway bridge over the Dee were manufactured at those works. They were tested before sent to the railway. Each girder was placed side by side and tested by 50 tons of iron being put on them in the centre. We took the deflection on every five tons, but have not got the particulars of those deflections. The ordinary pressure on the girders passing over them would not exceed 50

tons. After the girders had been tested we found a flaw in one of them; it was a mere honeycomb, and it was rectified before it was sent away. I have since examined the girder and found that the accident had not resulted from the flaw. The fractures were in the sound metal. I superintended the fixing of the girders. There are many railway bridges of the same kind. On the Trent Valley line there are eight of the kind. It is not opened to the public as yet, but on the Blackwall railway there are several that have had heavy trains passing over them for years. The one over the Dee is the largest. I never heard of any of them giving way. Had been several times to view the bridge when trains were passing over it, and found the deflection very trivial, not much more than an inch.

Major General Sir Charles William Pasley.—I was the government inspector general of railways when the Chester and Holyhead railway was opened. I surveyed the bridge over the river Dee on October 20th, and reported it as safe. I compared the plans with the actual building, and examined it in such detail as I deemed necessary. It is an iron girder bridge, of three openings or spans of 98 feet each; wrought iron tension rods are used to strengthen it. I always was of opinion, and am so still, that these tension rods are not of great use, because I consider that the expansion of wrought and cast iron from heat differs in some degree, although not very greatly; but that iron girders being very massive and the tension bars thin and of small dimensions, the sun may act on the wrought iron rods very considerably and less on the cast iron girders; and supposing them to be adjusted for a moderate temperature the intensity of hot weather may destroy their proper proportion, and do away with the benefit of the tension. I may here state that wrought iron, when acted upon, will elongate considerably without breaking, but cast iron will not without breaking. There have been a number of bridges of this description erected on railways in various parts of England, both before and after I held the appointment of inspector general of railways, none of which, with the exception of this one, ever failed. They were not quite of the same extent, but I will allude to a cast iron girder bridge at York, over the river Ouse, of the York and Scarborough railway, which has two openings of 70 feet span. The least depth of the iron girder on that bridge is 3ft. The least depth of those on the Dee bridge is 3ft. 9in.; and as the bridge at York and other similar bridges have stood, I concluded that this one would, as it had an extra depth. I may also mention another bridge over the Tees, at Stockton, although I have not seen it. I may vouch for what I say to be correct. It has a span of 83ft. 4in., and the least depth of iron is 3ft.

Mr. R. Stephenson said it was 87ft.

General Pasley.—I thought it was what I stated, but you may be correct. The flange on this bridge is greater than on others. I have frequently mentioned to engineers that wrought iron tension rods would do but little good. In my inspection of a cast iron girder

bridge, on the Syston and Peterborough railway, built by Mr. Liddle, the resident engineer, I found that he had omitted tension bars, and in my report to the Earl of Clarendon I approved of the omission, and considered it a preferable construction. It appeared that Mr. Liddle could not get the tension rods in time, and therefore he built the bridge without them. Having mentioned this repeatedly to engineers, and having been given to understand that Mr. Bidder and Mr. Gooch have made experiments with a view of testing the strength of girders without rods, I am informed that the trial was in favor of the latter. As to the cause of the accident—it has been stated that some time after the Shrewsbury and Chester railway was opened and after I had inspected it, a girder was cracked, and was replaced by a new one.—This circumstance which I did not know, and which was never reported to government, coupled with the fracture of this one, induces me to think they are not safe, and that it is the mere cast of a die between their danger and safety. I consider that the tension rods are of very little use indeed. The tension rods are connected with the girder alone, as if they were part of it. They have no independent support, and there is a difference between this bridge and Mr. Stevenson's former iron girder bridges. In all his former girder bridges there is a connection from girder to girder, on the central pier or piers, from one end of the bridge to the other, so that when the pressure is on one girder, the other girder in the same line contributes to assist. That is the case with the one on the river Ouse at York. The horizontal portion of these bars appears to be useless. The oblique tension bars would be of use if the upper ends were fixed to some independent support to each pier, and similar independent support on each abutment, and if the standards or support over the abutments had tension bars extending inland to resist the heavy weight going over the extreme bays or openings of the bridge. There is a swing bridge over the river Wensham, at Norwich, strengthened on this principle, and which is extremely judicious. In this case I consider that the girder broke on a train passing over, and to the weight of the ballast that had been thrown on it in the course of the morning. The masonry gave way from the girder breaking, and from that cause alone. I examined the girder; and the castings seemed very good, and I believe it is generally admitted that they are good; but the girder was too weak after the ballast that was put upon it. The girder was far enough in the masonry to support it. There was quite bearing enough to render it secure. I do not think the engine driver suddenly putting on the steam would cause the engine to bound with such force as to break the girder. I saw nothing to throw the carriages off the rails on the bridge, which had strong guard rails. I should say that no girder could have withstood a deflection of  $5\frac{1}{2}$  inches. It would have broken short at once. A continued deflection of four inches must have broken it long before this occurred.

Mr. Robert Stevenson put in a written re-

port on the accident; from which it appeared that on the day it occurred, and only a few hours previously, he had narrowly inspected every part of the bridge, and saw nothing to indicate weakness. He had carefully examined into every circumstance connected with the disaster, and for reasons which he gave, was satisfied that it arose from a violent blow against the girder, near to the abutment on the Saltney side, caused by the train getting off the rails. The report said:

"It has been suggested that the unequal expansion and contraction of the girder, during great changes of temperature, might probably interfere with the uniform strength of the metal. It is impossible to deny that this circumstance does sometimes interfere with the strength of cast iron beams, but generally this influence may be regarded as confined to castings where the thickness of the different parts vary considerably. In the present case the form of the castings was carefully studied, and with only such small deviation from absolute uniformity in all the thicknesses of the different parts of the section, as practice has long proved to be justifiable.

"With regard to the competent strength of the structure, I concur generally in the deduction drawn by Mr. Yarrow, in which I am confirmed by an extensive experience in the construction and use of similar structures, tried under circumstances that demonstrate their capabilities to meet all the ordinary contingencies of railway traffic."

Mr. James Kennedy, of the firm of Bury & Kennedy, Liverpool, was recalled, and confirmed the opinion he had given at the last meeting as to the probable cause of the accident. The girder might have given way either from a blow, or the extra weight of ballast and the train on it. Cast iron girders were capable of sustaining in the centre 70 tons; but if the tension rods were not perfectly adjusted, he did not think the bridge safe for ordinary trains. He did not think damp ballast placed on the bridge would affect the temperature of the girders so as to cause them to break.

Mr. H. Robertson, the engineer of the Shrewsbury and Chester railway, was next called, and said—I have examined the bridge since the accident. My opinion is that the bridge broke under the weight of the engine and train, increased to a large extent by the laying down of 25 tons of ballast on the platform just previous to the accident. The witness then handed in a lengthened report which he had made to the directors, respecting the failure of the bridge, in which he stated that the fracture spoken of by Mr. R. Stephenson as having been produced by a lateral blow, was, in his opinion, caused after the girder had fallen, and that the fracture which caused the bridge to give way was that in the centre. He considered that the tension rods tended more to weaken the girder than to strengthen it.

Mr. Robertson then read the following report which he had made to the directors of the Shrewsbury and Chester railway:

"I minutely examined the Dee bridge on the Chester and Holyhead railway on the oc-

currence of the accident. I have caused drawings to be prepared, and also a model, showing the details of the structure and the fragments of the beam, in so far as now discovered; and to these I would refer you, instead of attempting to give a written description of the bridge (These were produced in court, for the inspection of the coroner and jury.) You will perceive that there are two principal fractures in the beam—one near the centre, 5½ feet from the west abutment in the middle portion of the girder; the other in the portion of the girder next to the abutment, and 20 feet from its fence. The latter fracture appears to me, from its form, and especially from the position in which the fragment lay, as shown in the ground plan taken the morning after the accident, to have been caused by the fall; any disturbing cause previously to the fall is quite inconsistent with the close proximity of the fragments. The fracture at the centre, from the position of the fallen portion, and of the middle tension rod wrapped over the girder, and especially from the form of the fracture, appears to me to have first taken place. This fracture I consider to have resulted from the weakness of the top flange, which was compressed and broken from the strain arising from the rolling weight of the engine and tender, and the vibratory motion of the structure itself, increased to a large extent by the deposit of 25 tons of ballast on the roadway immediately before the accident. This compression is remarkably evident by the bulging out of the metal at the point of the parting at the top of the web, or vertical portion of the girder.

"In estimating the strength of the girder, I am of opinion that the tension rods, from the form of the section of the girder, weakened it, and threw an undue strain, by compression, on the top flange; but, assuming that they did not weaken it, and applying the formula as given by Eaton Hodgkinson, F.R.S., to the girders—by one formula, the breaking weight is equal to 61½ tons; and, by the other, the breaking weight is equal to 76 tons. Now, it has been an established rule in practice, that one-third or one-fourth of the breaking weight is the safe working weight to which a girder should be subjected, and the larger the size, the smaller ought to be the proportion; taking, therefore, one-fourth of 56 (the breaking weight) it follows that the safe weight to which one of the girders ought to be subjected is 14½, and the two girders 37 ton. The weight of the timber, platform, beams, rails, chairs, etc., exclusive of the girder, according to an approximate calculation I made, is 19 tons 6 cwt.; and, adopting the rule that a uniform weight is diffused over the beam, is equivalent to one-half that weight suspended at the centre, this becomes equal to a weight suspended at the centre of 9 tons 13 cwt. The equivalent weight of an engine and tender of 33 tons 10 cwt. 2 qr., suspended at the centre of the beam, I estimate at 33 tons—making a strain of 41 tons 10 cwt. against 37 tons—the safe working strain to which the bridge ought to be subjected. However, on the afternoon of the accident, immediately previous to the passing of the

train, the bridge was subjected to an additional strain, by the laying of five inches of broken red sand stone ballast, amounting to a weight over the bridge of 25 tons; which is equivalent to a weight suspended at the centre of 12 tons 10 cwt. This makes a total of 54 tons against the safe strain of 37 tons formerly stated; and the last addition appears to me to be the immediate cause of the accident. In these calculations, however, it is assumed that everything is at rest, and that the forces applied are those resulting from direct pressure, while the evidence shows that there is a vibratory movement of the whole structure to a large extent; and there is, besides, a percussive movement of the engine and tender, which, with a heavy long boiler engine, with outside cylinder, is considerable.

"The weight of the structure, and of the train in motion, will be about 164 tons in all, and the strain from this cause must be added to that formerly stated. This strain, though it cannot be ascertained by accuracy of calculation, founded on experiment, experience shows to be great; and I am of opinion that it formed a large element in the strain which broke the bridge down. There is also the whole gross strain arising from the pressure and the percussion of the structure and its load, with the apportionment of that strain between the girders: for I am of opinion that, from the loose and independent connection of the girders, and the giving of the structure, the strain may have been unequally divided between the girders. These investigations, independently of the evidence of the eye-witnesses, lead me to the conclusion, that the girder broke in the middle from its weakness to resist the strain, increased by the laying on of the ballast.

"The opinions of Mr. Stephenson and Mr. Locke, founded on the alleged facts as to the paint on the tender, the broken carriage wheel, and the snips in the chairs, appear to fall to the ground, as they must have been misinformed on those particulars, which can all be disproved.

"HENRY ROBERTSON, Engineer."

"Chester, June 15, 1847."

Captain Symonds, R.E., and Mr. Walker, who were retained by government to examine into the cause of the accident, presented to the inquest a very lengthened report, the following are extracts from it:

"That the bridge was of sufficient strength if the cast and wrought iron be supposed to act together, each taking its equal proportion of the strain.

"That there is great difficulty in ensuring the joint action, and that if this is a part of the principle of the bridge, we do not approve of it.

"That neither the wrought nor the cast iron taken, separately, was sufficient for perfect stability; and that, to have ensured this, the cast iron girders alone should have been of sufficient strength to carry the whole weight, with an ample allowance for the various circumstances (some of them peculiar to this bridge) which we have explained.

"That, with the exception of the bends, or warps in the top flanges, the castings are of

good quality. That the wrought iron is also of good quality.

"That the stonework of the piers and abutments is good; and in no way contributed to the failure.

"We now come to the question, what was the immediate cause of the accident? As the bridge had carried as great or greater loads before, the suggestion that there was something peculiar in this case, as the end of a rail having projected from the straight line and been struck by the engine, or the tender having got off the line and struck the girder laterally, is not improbable. The engineers who were called by the railway company considered that the breaking of one leaf of the wrought iron that was next the tender, the piece that was struck out of the girder, and the damage to the abutment wall, are all proof of the fact that the accident was caused by the tender having got off the line, and broken the girder by a heavy lateral blow. We refer to the evidence of Mr. Robert Stephenson, Mr. Locke, Mr. Vignoles, and Mr. Gooch, who were also of opinion that the strength of the girder was sufficient. As to this latter point, we have already stated the principles upon which alone this conclusion could have been arrived at, and our own opinion. As to the tender, or the carriage immediately behind it, having got off the railway and damaged the abutment walls, there is no doubt; and if the tender struck the side of the girder, when the latter was under great strain, a fracture was the probable consequence. This is on the presumption of the tender having got off the line from some other cause than the breaking of the girder.

"Our own decided opinion, formed from the statement we have made as to the strength of the girder, and from the position in which the broken pieces were found, the two halves being each in a straight line, or nearly so, but at an angle with one another, is that the first fracture took place in the centre of the girder, and not at the end which rested on the abutment.

"In corroboration of this last view, the addition that was made to the permanent weight of the bridge, immediately before the accident by the ballast spread over it, and the fact that when a weight, partly permanent and partly passing, but which together formed a considerable portion of the breaking weight of the girder, are in continual operation, flat girders of cast iron suffer injury, as their strength becomes reduced; and if, when this has taken place, the momentum of the passing weight is increased by an irregularity of the rails, or in the motion of the engine, to which the best made and managed railways are subject, a fracture is likely to follow. The probability of this having been so in the present case, and the fact of the tender having been off the line, and having been drawn up with great violence, so as to break the end piece of the girder by the blow, are to be weighed against each other in assigning the cause of the accident.

"Having reference to other cases, it is proper to state that Mr. Robert Stephenson stated in his evidence that he had erected a number

of bridges, on the same principle as this, and that this was the first failure. We have not examined these bridges; they are stated to be all of a less span than the Chester bridge, but that the proportions of the parts are proportionally less; and it may perhaps be argued from the above numerous examples, and the opinions of the eminent engineers opposed by this one failure, that we are mistaken in considering the weakness of the girder to be the cause of the failure in the present case, and unnecessarily cautious in the objection we entertain, and have expressed, as to the principle of this bridge and its security; but as we entertain these opinions very decidedly, it is our duty (by no means an agreeable one) to express them."

*The Verdict of the Jury.*—After an hour's deliberation, the foreman, Sir E. Walker, returned the following as the unanimous verdict of the jury:

"We find that George Roberts, John Matthews and Charles Nevitt, were accidentally killed on the evening of the 24th of May last, in the parish of St. Mary-on-the-Hill, in the city of Chester, by being precipitated along with a train of carriages on the bank or bed of the river Dee, from the breakage of one of the 12 cast iron girders constituting the railway bridge over that river.

"We find also that Isaac Powis died on the 26th of May, from injuries he received at the same time and place, and the like cause; and we find that Thomas Anderson came by his death on the 24th of May last, in the parish aforesaid, by being accidentally thrown from the tender on to the rails.

"We are further unanimously of opinion, that the aforesaid girder did not break from any lateral blow of the engine, tender, carriage or van, or from any fault or defect in the masonry of the piers or abutments; but from its being made of a strength insufficient to bear the pressure of quick trains passing over it.

"We feel that the 11 remaining girders, having been cast from the same pattern and of the same strength, are equally weak, and consequently equally dangerous for quick or passenger trains as was the broken one.

"We consider we should not be doing our duty towards the public if we separated without expressing our unanimous opinion, that no girder bridge of so brittle and treacherous a metal as cast iron alone, even though trussed with wrought iron rods, is safe for quick or passenger trains; and we have it in evidence before us, that there are upwards of 100 bridges similar in principle and form to the late one over the river Dee, either in use or in the course of being constructed, on various lines of railway. We consider all these unsafe, more or less, in proportion to the span—still, all unsafe.

"We therefore call upon her majesty's government to institute such an inquiry, into the merits or demerits of these bridges, as shall either condemn the principle, or establish their safety to such a degree, that passengers may rest fully satisfied there is no danger, although such bridge may deflect from  $1\frac{1}{4}$  to 5 inches."

The coroner stated that that portion which related to the death of the deceased could only be taken as their verdict. Their recommendations, however, he would forward to the railway department of her majesty's government; and no doubt the press would give them due publicity.

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.** Proposals will be received at this office, and at the office of the Resident Engineer, in Gardiner, until the 21st of August, for the Grading and Masonry of 21 miles of this road, extending from Bowdoinham to Augusta.

The line of road and the place and profiles will be ready for examination on the 19th of August, after which time any information in relation to the work can be had at the engineer's office in Brunswick and Gardiner, or of the resident engineer on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to complete the work.

The remainder of the line from North Yarmouth to the depot of the Portland, Saco and Portsmouth Railroad in Portland, 15 miles, will be ready for contract on the 18th of September, of which due notice will be given. **GEORGE S. GREENE,**

Engineer K. & P. R. R.

ENGINEER'S OFFICE, K. & P. R. R.  
Brunswick, July, 12, 1847. }

233

**NOTICE TO CONTRACTORS.—ANDROS-COGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Railroad Office, in Lewiston, until the 17th of August next, inclusive, for the Grading and Masonry of the 3d Division of this Road, extending from Green to Belgrade, near Snow's Pond, about 20 miles.

Profiles will be ready for examination on and after the 10th of August, and all necessary information will be given, either at this office, or upon application to the resident engineers on the line of the road.

Satisfactory bonds with sureties shall be given by the bidders, if required.

On the 16th of August, the Engineer will be prepared to accompany Contractors over the line of the road, commencing at the eastern end of the Division in Belgrade.

**HOBART CLARK, Agent A. & K. R. R.**

**EDWARD APPLETON, Engineer.**  
Railroad Office, Lewiston,  
July 12, 1847. }

313

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

**C. B. STUART, Engineer.**

Hamilton, July 30, 1847.

ROBERT GRACIE.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cores, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

**IRVING VAN WART,**  
19 Platt street, New York.

**JOB CUTLER, Patentee.**

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/4 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

**JOAN F. WINSLOW, Agent,**  
1y Albany Iron and Nail Works,

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons 2 1/2 x 1/2 inch Flat Punched Rails, 20 ft. long; 25 " 3 1/2 x 1/2 " Flange Iron Rails.  
75 " 1 x 1/2 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**THE SUBSCRIBERS ARE PREPARED TO**  
execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

**REEVES, BUCK & CO.,**  
Philadelphia.  
**ROBERT NICHOLS, Agent,**  
No. 79 Water St., New York.

26tf

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.  
ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by  
**JOHN A. ROEBLING, Civil Engineer,**  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.  
2v1917

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norris-town Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Stiers, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinkley & Drury, Boston, will be promptly executed.

**FRENCH & BAIRD.**  
N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

**JOHN F. WINSLOW, Agent.**  
Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**  
Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

**Cotton, Wool and Flax Machinery**  
of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.  
Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestles are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestles, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestles for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 33f

## LAP—WELDED WROUGHT IRON TUBES

FOR  
**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

**P**IG AND BLOOM IRON.—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,

143 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

ber having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.  
These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.			Weight per fathom.	Diameter of iron.	
	INCH.	LBS.	OZ.	INCH.	LBS.	OZ.		LBS.	INCH.	
11	4 1/4	13	5	10	24	-		50	15-16	20
13	3 1/4	8	3	8 1/4	16	-		27	11-16	13 1/4
14	3 1/8	6	11	7 1/4	12	8		17	9-16	10 1/4
15	2 3/4	5	2	6 1/4	9	4		13 1/2	1-2	7 1/4
16	2 1/4	4	3	6	8	8		10 1/4	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Jan. 14, 1846. [1y4] Philadelphia, Pa.

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2. [116] 68 Broad St., New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

ja45 Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

ja45 N. E. cor. 12th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,

No. 139 Greenwich, corner of Cedar street.

June 1, 1847. 101

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail. 40it

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to **HENRY ANDREWS**, 48 State st., or to **CURTIS, LEAVENS & CO.**, 106 State st., Boston, or to **A. & G. RALSTON & Co.**, Philadelphia. ja45

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS**, Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 117

**PATENT INDESTRUCTIBLE WATER**

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28th

J. BALL &amp; CO.

**CONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads.** On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON**, Agent.

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	.....\$1 00
" " " Xenia	.....1 50
" " " Springfield	.....2 00
" " " Columbus	.....4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

47th W. H. CLEMENT, Sup't.

**PATERSON RAILROAD**

Summer Arrangement.

Commencing April 20th, 1847, the cars will leave	
Paterson at	New York at
8 o'clock a.m.	9½ o'clock a.m.
11½ o'clock a.m.	12 1-4 o'clock p.m.
4 o'clock p.m.	5½ o'clock p.m.

On Sunday.

8 o'clock a.m.	9½ o'clock a.m.
4 o'clock p.m.	5½ o'clock p.m.

25th Office 75 Courtland St.

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, August 28, 1847.

### Auburn and Rochester Railroad.

We have received the following statement in relation to this road. It is gratifying to know that the company is doing so well—and especially to learn that they are relaying the road with heavy iron.—Such a course will soon be—if it is not already—absolutely necessary, that higher speed and heavier freights may be the order of the day. The time is at hand when a large amount of freight must pass over this road.

Office of the Auburn and Rochester R. R. Co.  
Canandaigua, August 7, 1847.

Sir: Herewith we send you a statement of the receipts and expenses of operating our road for the last six months, by which you will perceive that after paying a semi-annual dividend of 4 per cent. to our stockholders, on the 1st instant, we have over, of the six months' profits, \$52,327 35 to add to our account of surplus profits, making said account now good for \$261,961 20.

We have commenced relaying the road with a heavy iron rail, 60 pounds to the yard. We intend to complete 20 miles this summer, 30 miles next season, and the remaining 38 miles in the summer of 1849. The funds necessary for this object are procured (by the issue of new stock, taken up on the line of the road, and bonds convertible into stock,) within two hundred and fifty thousand dollars of the full amount required to complete the relaying, etc.,

of the entire road, from Auburn to Rochester, 78 miles. This amount of stock we can at any time get taken up in the country, but for the present we shall not dispose of it.

The cost of the road up to the 1st inst., is \$1,880,749 60. When completed with the iron rail, it will have cost, including depots, machine shops, store houses, locomotives, passenger cars, freight cars, etc., two millions and a half of dollars.

Yours respectfully,

HENRY B. GIBSON, President.

CHARLES SEYMOUR, Treasurer.

### Baltimore and Ohio Railroad Termination.

At a meeting of the Stockholders of this road, on the 25th inst., it was decided to accept of the law of the last Legislature of Virginia, which authorizes its construction through that State, on condition that Wheeling is made the terminus.

The question of terminus has cost this company a great deal of trouble—and a large outlay of capital. They have been for years arrested in their progress, and the business community has been taxed millions of dollars, in time and money, for want of a railroad from Cumberland to the Ohio river.

This delay ought not to have occurred; but the company has been dependant upon foreign legislation—that is, the legislation of States having rival interests—and therefore it has had difficulties, far

greater than the mountains in their path, to overcome. They have at length accepted the only route open to them; and, even if it is not the best that could be found, it is to be hoped that it will be completed at an early day, and that it will be found far better than is anticipated even by its warmest friends.

### Coal Trade.

We have been furnished with the following statement of the coal sent to market by the Schuylkill canal—which we shall publish as furnished weekly.

SCHUYLKILL NAVIGATION.—Week ending August 19th, 1847.

	Tons. cwt.
Pottsville and Port Carbon.....	6,144 03
Schuylkill Haven.....	1,222 11
Port Clinton.....	00 00
This week.....	7,366 14
Previously.....	114,591 00
Total.....	121,956 14

### Railway Traffic.

"From our official returns," says the Railway Chronicle of July 24th, "it appears that the amount of traffic for the last week, on upwards of 3,153 miles of railway, was £185,955, thus accounted for: £106,542 for the conveyance of passengers only, £40,264 for the carriage of goods, and a remainder of £39,149 for passengers and goods together, not respectively apportioned; being an increase of 25,165 over the corresponding week of last year, when the mileage was about 2,290."

From this it appears that 864 miles of road have been brought into use during the past year—more than one-fourth part of the railroads in the kingdom from which returns of traffic have been made.

### Extracts from our Foreign Papers.

We have received, by the Cambria, our regular supply of English railway and mining papers, from which we make the following extracts:

**The Iron Trade.**—The price of rails, July 23d, was quoted at £9 per ton. A correspondent of the Mining Journal says that "a good demand continues for Welsh bars, and price is very firm. Scotch pig has fluctuated a little this week, but the transactions have been limited, and holders will not take less than 70s. for mixed Nos. In Swedish iron and steel very little doing since last Mining Journal."

**Glasgow Pig Iron Trade, July 22.**—"Since date of last Mining Journal, a fair amount of business has been done. The fluctuations in price have been frequent, but inconsiderable in extent. Sales of

mixed Nos. have been made at 70s. and 71s.—cash in 14 days. There is less inquiry to-day than for some days past. For mixed Nos. the price may be quoted nominally 70s. cash—free on board."

On the 30th the quotations for rails was the same as on 23d, £9 average, and other kinds "remain without change as to prices, but the demand is not so good as it was about two weeks since; of Swedish iron and steel no recent sales."

**Glasgow Pig Iron Trade, July 29.**—We have had a very quiet week in pig iron; at the end of last week prices receded, and mixed Nos. were sold at 69s., cash; the market has since rallied a little, and sales effected at 69s. 6d.; mixed Nos. have been sold this week at 71s. 6d. to 72s., three months, open delivery. We quote the price of mixed Nos. at 69s. 6d. to 70s.—cash, free on board, buyers at 69s.

**Railway Engineers in Parliament.**—The Railway Record says that "the first railway engineer elected into parliament is Mr. Locke, for Honiton."

"Mr. Booth's suggestion for adopting uniformity of time is likely to be practically realized soon.—The electric telegraph company are now making arrangements to communicate the true time, as observed at the Royal Observatory at Greenwich, to every station on the various lines of railway where the company has a telegraph station, and, of course, to all large towns throughout the kingdom."

**Cost of an Excursion from London to Baden, Brussels, Paris, and back to London.**—We find the following statement in Herapath's Journal of July 31st:

"In the *Bologne Gazette* there is a statement showing the fares for conveying one person, and the charges for luggage in a journey from London to Baden-Baden, and from the latter via Brussels, to Paris, and thence back to London. Miles travelled 1,514; time occupied in travelling, 111½ hours;—fares, £10 10s. 6d.; charge for luggage, £1 7s. 6d.—total, £11 18s. There were from 90 to 96 pounds of luggage carried. No luggage was allowed free on either the Belgian or German lines. On the French Northern luggage of 60 lbs. was, but all in excess charged."

This is less than two pence per mile.

**London and York Railway.**—It is said that 150 miles of this line will be opened for traffic in the next year.

#### Railway Bills Sanctioned by the Queen.

"On Thursday, 23d July," says Herapath, "53 railway bills received the royal assent; these, with the 136 previously sanctioned, make 189 railway bills which have received the royal assent during the session of 1847. The aggregate capital authorized to be raised by those bills amounts to £26,156,735, and the loan to £8,611,011—total £34,767,746. The aggregate number of miles thus authorized to be constructed is 1,415, chiefly consisting of short branches."

#### Railroad from Springfield (O.) to Columbus.

A reconnoissance of so much of this proposed road, says the Springfield Republican, as lies between Springfield and London, was made by an engineer, accompanied by Mr. Forrer, of Dayton, and other gentlemen, during the past week. The route was found very favorable. Passing up the valley of Mill Run about two miles, the route strikes the section line south of Springfield, on a ridge between Beaver Creek valley, and the waters of the Little Miami. This line may be travelled with but a single slight variation on the Darby Plains very little north of London. This route will be surveyed without delay, and an estimate made of the cost of construction.

#### Locomotive Engines and Cars on the Different Railroads in the United States.

In reply to our request in the Journal of 24th ult., we have been furnished with the following tabular statement of the names and length of the railways in the State of New York, together with the number of locomotives and cars employed on them January 1, 1847.

NAMES OF RAILWAYS.	Length of road.	No. of locomotives.	No. of passenger cars.	No. of freight cars.	No. of mail, baggage and other cars.	Total No. of cars.

Engineer's Office of Great Western Railway, Hamilton, July 30, 1847.

DEAR SIR: In your Journal of 24th instant, you ask, "How many cars, passenger and freight, are there on the American railways?" Above I send you a statement, which I believe to be correct, of the number of locomotives and cars on all the railways of the State of New York, January 1st, 1847. I hope some one will give those in other States, as it would be interesting to know the whole number.

With respect, yours, etc.

C. B. STUART.

This is precisely what we wanted in relation to the roads in the State of New York—for which we are much indebted to Mr. Stuart, who has so promptly responded to our call, in the midst of his arduous duties as engineer of that important work, the 'Great Western (Canada) Railway.' We shall be equally obliged to other friends who may prepare similar statements in relation to other States, or for individual roads, and we will perform our part of the work by including them in our next edition of the 'Table of Railroads in the United States,' should we be successful in getting returns from roads holding a majority of engines and cars in use.

#### For the American Railroad Journal. The First Locomotive.

I have a small volume, copies of which, though it was published no longer ago than 1813, are now extremely rare. It is entitled "Patent Right Oppression Exposed." The text which is ironical, and in burlesque verse, is probably from the pen of Richard Folwell, the publisher. The notes, which at this day, alone give interest to the work, were evidently prepared by Oliver Evans. A few of these notes I shall proceed to extract.

"The principles on which steamboats and steam wagons may be driven, were discovered by Mr. Evans in 1773. Some years afterwards he applied to the legislature of Pennsylvania, to secure him the right for twenty-five years, in which application he was directed and assisted by his friend, George Latimer, Esq., but they notwithstanding treated his memorial as if they thought him insane. He then applied to the legislature of Maryland, where, through the influence of Jesse Hollingsworth, Esq., then one of its members, he obtained a patent for fourteen years, which, however, was too short a period, or people of wealth were not sufficiently acquainted with the principles, to be interested in making the experiment, and his own circumstances were so straitened as not to admit it."

"In this petition he did not include steamboats, because Ramsey and Fitch were at

that time contending about their originality of invention in the application of such engines as were then known. Besides, he entertained an opinion that the western waters were those only where steamboats would be highly useful."

From this statement, it appears that Mr. Evans discovered in 1773, "the principles on which steamboats and steam wagons may be driven," though it was not till 1786 or 1787 that he made his application to the legislature of Pennsylvania. Seventeen years afterwards, as appears from the following extract, he succeeded in propelling by means of steam a very lumbering vehicle on dry land.

"Mr. Evans constructed for the Board of Health, Philadelphia, 1804, at the corner of Ninth and Market streets, a machine for cleaning docks. It consisted of a heavy flat, with machinery to be wrought by a steam engine, the cylinder of which was only five inches diameter, stroke of piston nineteen inches; the weight of the whole complete was equal to that of two hundred barrels of flour. This he conceived to be a fine opportunity to convince the public that his steam engine would propel both carriages and boats. He at the expense of two hundred and fifty dollars, to try the experiment, made wheels and other temporary machinery, with wooden axles, to apply the power of this little engine, with which he propelled this great weight up Mar-

ket street, and round the circles where the water works are set,\* and onward into the Schuylkill, about a mile and a half."

This, is, I believe, the first instance on record, of a carriage propelled by steam on dry land. If I am wrong, you, Mr. Editor, can set me right. If I am right, let justice be done to the memory of Oliver Evans.

The narrative proceeds as follows:

"He then applied a paddle wheel in a temporary manner, and propelled it (the flat) down the Schuylkill and up the Delaware to the city, a distance of sixteen miles, leaving all the vessels that were under sail at least half way, (the wind being ahead,) in the presence of thousands of spectators, which he supposed would convince them of the practicability of both steam carriages and steam-boats. But in this he was sadly disappointed, for they made no allowance for the disproportion of the engine to its great load, nor for the temporary manner in which the machinery was fixed, nor the great friction, ill form of the boat, and but supposed it was the utmost he could do."

I will give a few extracts from another part of this volume. They are introduced in the original in the form of a prophecy.

"The time will come when people will travel in stages moved by steam engines, from one city to another, almost as fast as birds can fly, fifteen or twenty miles an hour.

"A carriage will set out from Washington in the morning, the passengers will breakfast at Baltimore, dine at Philadelphia, and sup at New York, the same day.

"To accomplish this, two sets of railways will be laid, so nearly level as not to deviate more than two degrees from a horizontal line—made of wood or iron."

When, in the year 1813, these prophecies were uttered, the author must have been regarded by most of his contemporaries as a madman. It is needless to observe how nearly to the letter his prophecies have been fulfilled.

To the Americans, the world is indebted for the first steamboat. It was not the fault of Oliver Evans that the world is not indebted to the Americans for the first railroad also. W. M. G.

Washington City, D. C., Aug. 18, 1847.

We are obliged to the writer of the foregoing communication, for this opportunity of reminding those, who now enjoy the reality of the predictions of Oliver Evans, to whom they are so much indebted as one of the pioneers in the great work of applying steam to navigation, not only on the water, but also on land.

#### Watertown, Rome and Cape Vincent Railroad.

We have not heard much in relation to this railroad for many months past, but the following excellent letter, addressed to a gentleman in Watertown, by a *Bostonian*, in relation to this particular road, and railroads in general, is so truth-like, and applies so well to many other localities, and proposed railroads, that we give it entire.

The road here referred to is designed to open a communication from Cape Vincent on the St. Lawrence, through Watertown, to Rome, there to connect with the line from Buffalo to Albany—and thus

\* The water works here alluded to were at the intersection of Broad and Market streets.

open a communication direct with the "Black river country," Lake Ontario and Canada.

The writer of this letter speaks from personal knowledge on most of the points—and his advice is so good, and so applicable to many other sections, that we should like it much better if we could put the Railroad Journal containing it into the hands of every property holder in the Union.

"The following letter," says the Northern State Journal, "is from a gentleman in Boston, of high standing and long experience in everything relating to the character and influence of railroads on the various interests of New England, and is in answer to one from a gentleman of this place. The public are requested to give it a careful perusal. Its doctrines are sound, the authority is unquestionable, and it relates to a subject of vital interest to this country. Let us one and all arouse from our lethargy, and by one noble effort accomplish this great object. The God of Nature has bestowed his good gifts upon this country with a bountiful hand, and if we are just to ourselves this will soon become one of the most desirable portions of the Union."

DEAR SIR. Your favor of the 3d of August was duly received, and I hasten to answer the various questions it presents.

You ask me to state what connection I have had with railroads. Let me reply that, although a member of the legal profession, I have for the past twelve years been engaged in the direction of steamboats and railroads, and for seven years been closely connected with several of the most important enterprises of the State.

Early in 1840 I was chosen director of the Western railroad, and appointed chairman of the committee which in that year visited Albany, secured the bonds of the city, and planned the extension of the Western railroad to the Hudson. For the four following years I was in the direction of that enterprise, while it struggled through the mountains of Berkshire. Subsequently I have been director of the Fitchburg and Montreal railroad, the first of which is in most successful operation, while the second is expected to be set in motion the present fall. Having taken an active part in conducting these enterprises, owning a country seat between the Fitchburg and Worcester lines, over both of which I pass often in summer, and acting as counsel also in cases of nearly all our lines of railroad, I have enjoyed an opportunity to test the effects of a railroad on the farms and villages of our State.

Although I feel a deep interest in the progress of my native State, and I trust a laudable pride in her rapid advancement, I trust that I do not forget that I am a citizen of the Union, and can permit no State lines to limit my philanthropy, or restrain me from communicating any light I have derived from my position. You ask me if railroads are monopolies. At first our lines were not conducted on the most liberal spirit. Our early directors were timid, and the charges were fixed at four cents per mile for passengers, and eight cents for freight. I have ever been a zealous advocate for low prices, as alike beneficial to the lines and the public. For a long time I wrote and urged the point. I was met at first by incredulous smiles and determined resistance, but argument and ex-

perience at length prevailed. Four years since our rates were reduced nearly one-half, and ever since an increasing prosperity has attended all our lines. Villages are growing up at every station, farms improving and rising in value, and our lines are now conducted in a most accommodative spirit. If monopolies, they are most liberal monopolies, for the tendency of rates is certainly diminished, and the accommodation of the public in speed, cars, depots and frequent trains, is annually increasing. Around the depot at West Newton a large village is growing up, and land has risen from \$50 per acre to prices varying from \$200 to \$1000 per acre. At Fitchburg the population has risen in three years from 3000 to 6000 souls—the effect of the railroad alone. Milk is now carried 45 miles, from Leominster to Boston, and a train of five milk cars attached to the passenger cars, arrives every morning at the Charlestown depot.

Under the influence of railroads, and of manufactures stimulated thereby, the old Bay State has ceased to be an emigrating State. It receives more than it sends forth, and will show by the next census nearly if not quite a million of inhabitants on 700 square miles of rugged land, smiling under the hand of untiring industry, and sparkling with new and beautiful structures.

You ask me to compare railroads with canals. Let me reply that the former are in almost every particular superior. Give me a good and untrammelled line of railroad beside your Erie canal, and its branches, and successful as it now is, I think I would engage to divert its traffic in five years, and leave it without patronage sufficient to keep it in repair. In New York you have as yet enjoyed no perfect lines of railroads. I cannot regard a line with a strap rail, nearly incompetent to carry freight, like that from Buffalo to Albany, as a railroad. Thank heaven we have none of them here. A true railroad is susceptible of a speed of 40 miles per hour, and its capacity reaches to millions of tons and millions of passengers to pass over it annually.

It can live, too, where a canal must perish for want of business. A railroad costing but \$18,000 per mile, can live upon a line which sustains but four daily stages, and ten daily baggage wagons in each direction, and pay large dividends; but a district with this business at ordinary tolls, would not keep a canal in repair.

A railroad surmounts summits inaccessible to a canal. It regards not the drought of summer or the ice of winter. By speed it gives value to produce canals cannot transport, and commands the travel against all competition. It almost annihilates time and space.

In Massachusetts we had three canals.—First the Middlesex, which your commissioners came to examine before they begun the Erie. It paid good dividends, but is now worthless, for it has been completely put down by the Lowell railroad built beside it. Second the Blackstone. A railroad will this fall be opened on its banks, and all or

nearly all of the canal will be abandoned.—Third the Hampshire, from New Haven to Northampton. A railroad is now in progress along its tow path. *We have done with canals.*

You ask me the cost of transportation on railroads. It rises and falls with the quantity conveyed. When business rises to 200,000 tons a year, freight can be transported on a line like yours at a cost of six-tenths of a cent per ton a mile, exclusive of loading and unloading. It has been moved for less.—This charge would include the wear and deterioration of cars, and the repairs of the road.

On the Erie canal the average cost, inclusive of interest on boats and horses, but exclusive of canal repairs and attendance which may be offset, is nine-tenths of a cent per ton a mile, or fifty per cent. more. A line like yours, with 200,000 tons could do a most remunerating business at less than two cents per ton to a mile, but with 30,000 tons only must of course charge more to cover charges and interest on capital, say four cents per ton a mile. Two to two and one-half cents per mile pays well for passengers—better than higher charges.

You ask me if you should raise half the capital for your railroad, if you could borrow the *residue* here. If you move judiciously I think you may. I should begin at Rome and build 47 miles to the lake, as you suggest—thus make the first division productive. I think you could then borrow on 7 per cent. bonds enough to move onward and complete the line; but your lands would not sell until a portion was finished.

The avoidance of the canal toll and the shorter run, if your lake port is accessible, would give you considerable advantage over the Oswego line, perhaps a *dollar* per ton.

At the outset, it seems to me, you must rely upon yourselves, unless you look east towards Ogdensburg, which will soon be within 15 hours of Boston, with a \$7 fare. You must like Hercules put your own shoulder to the wheel. You must rely upon the *country*, not the city, like the *Fitchburg*. You must remember that a railroad, if you build it yourselves, takes *no capital* from the country, except for the *iron*, and that contractors take part of their pay in stock.

At some future day, when further advances are made, I may have the pleasure to visit your flourishing town, examine your noble water power, and investigate further the resources of your country, which well deserves a railroad, and which I believe I appreciate aright. I may then render you more effectual aid.

Meanwhile I remain yours very sincerely.

#### HIGH LEVEL BRIDGE.

On Friday, one of the metal arches for this great undertaking was tested at Messrs. Hawks, Crawshaw & Co.'s works, in the presence of Robert Stephenson, Esq., and several other scientific gentlemen. The arch is constructed on the bowstring principle, and is 125 feet span. The ends will rest upon metal plates fixed in the pier, and a small space

will be left for the alternate expansion and contraction of the arch. The arch consists of four ribs, each 3 feet 9 inches broad, of solid metal. The under roadway is suspended from these ribs by means of rods, which pass down the centre of the pillars—the upper part of these pillars serving at the same time as supports for the upper roadway.—There are also 14 transverse, and 8 longitudinal girders, which bind the whole compactly together—the balustrades are in keeping with the rest of the work. The arch was tested by a weight of 500 tons being put upon it, being double the weight to which it can by any possibility be put by the trains, etc., passing over it; and the result gave the most decided satisfaction to all present. With respect to the other works on the river, and the approaches on each side, all is progressing steadily but slowly. The piers for the southernmost river arch are so far completed, that the foundation stone is expected to be laid during the week. The approaches on the south side are rapidly advancing, most of the pillars for the arches are already erected.—Several of the metal pillars which form the direct approach are also reared at the Gateshead side of the river.—*Newcastle Adv.*

#### CRIMPLE VIADUCT.

This magnificent viaduct, says the Harrogate Herald, will, when completed, form one of the most wonderful of the achievements of science in railway construction in the kingdom. Its massy towering piers are now all reared, and its lofty expansive arches, stretching their wide concavities across deep glen, will shortly be brought to a close. Those of our readers who may be unacquainted with this structure, may feel somewhat interested by a brief description of its situation, and an accurate admeasurement of its gigantic form. Its situation is about a mile to the southeast of Harrogate; it is intended to convey the Harrogate and Church Fenton line of railway across the Crimple valley. The viaduct consists of 31 arches, each of 52 feet span, and the loftiest are 130 feet in height. The piers on which they rest, 32 in number, are about 20 feet each in thickness at the base, and are composed of immense blocks of hard granite. The top of each pier, immediately beneath the springer, is 8 feet, and the quoins 4 feet in thickness. The abutments are thickly flanked, and joined by lofty embankments. The line at the south end is carried through a long deep tunnel: while at the opposite extremity it proceeds along a deep rocky cutting. The whole length of the masonry is about 1856 feet. Between the first and second buttresses at the south end runs the line of the Leeds and Thirsk railway which is carried along the mountain side a considerable distance, and afterwards thrown across the vale by another viaduct, which, however, appears very diminutive, compared with the one described above. The part of the valley over which the monster viaduct is thrown, is a beautiful and romantic little defile between two high rocky mountains, whose steep and rugged sides are covered with a profusion of heath, brushwood,

and other kinds of vegetable life, indigenous to the mountain soil.

#### Pennsylvania the Pioneer in Internal Improvements.

*The Coal and Iron Trade of Pennsylvania in 1847.*

We have been favored with a copy of a pamphlet with the above title, from the pen of C. G. Childs, Esq., the able editor of the Philadelphia Commercial List, which we have read with some care and a deep interest. We have never before read a work of 24 pages that contained as much useful information—and there are few men, if any, who have done, in so small space, as much service to the business community, as the author of this unpretending pamphlet.

It not only claims for Philadelphia, and Pennsylvania, the credit of being the *pioneer* in many important matters, but, what is still better, it shows the claim to be just—especially in relation to the commencement of internal improvements, in the way of turnpike roads, and canals, banks, railroads, iron manufacture, the coal trade, etc., etc., etc.

The best evidence of the high estimation which we place on this production, will be found in the extent of our extracts and quotations from it—by permission, however, it being a copy right work. It should be read by every business man in the community.

The writer says of the "*Coal Trade*:"

The State of Pennsylvania has claims which seem to be imperfectly understood by her sisters of the Union. The reason probably is, that those claims have failed of being properly asserted. In the history of valuable discoveries and of pioneer operations in the great works which are to give character and wealth to our nation, Pennsylvania, and the city of Philadelphia in particular, is entitled to no secondary place. While all due honor is cheerfully accorded to the city of Boston, for the liberality and successful enterprise of her citizens, justice to Philadelphia demands that there should be, in the comparison, a more distinct remembrance of what she has done, than appears generally to prevail.

The great fact that in all works of internal improvement, Pennsylvania has been the pioneer, is one which eminently deserves the consideration of the country. If a wider range of details were taken, it would be interesting to dwell on such facts as these, viz: that the quadrant was here invented by Godfrey—that here Franklin taught men how to control the lightnings of heaven—that on the Delaware, at Philadelphia, John Fitch first proved the power of his rude steamboat, and that it was Fulton, a native of Pennsylvania, who immortalized his name, by maturing that wonderful invention—that the first locomotive was set in motion near the corner of Ninth and Market streets, by its inventor, Oliver Evans, who, with the foresight so often noticed as a characteristic of great discoverers, declared, that the time would come, when one would "breakfast in New York, dine at Philadelphia, and sup at Baltimore."

Here, in 1752, was opened the Pennsylvania hospital, the first public hospital in the United States. The first bank in this country, the bank of North America, was established here in 1780, with Robert Morris at its head: and the first insurance office, under the title of "The Philadelphia Contribution-

ship for insuring houses from loss by fire," had already been established here in 1762. Here, in 1793, was organized the first Sabbath school in the country, by the efforts of Bishop White, Thomas P. Cope, and a few other prominent citizens—an honor now appreciated throughout the Union. The first institution for the blind was that established in this city. The first medical college was opened here. The Academy of Fine Arts, instituted in 1806, was the first of the kind in this country. Philadelphia first showed what might be done in supplying cities with water, by her astonishing Fairmount Water Works. In her Eastern Penitentiary she furnished a model for institutions of that class which has been extensively approved and imitated, both in this country and in Europe. Here too before the revolution, the great discovery which has given us the magnetic telegraph, led Franklin to give signals by electricity across the Schuylkill.

In such a review, it might be added that the merchants of Philadelphia had the patriotism, and the liberality, to build a frigate, (the Philadelphia) and present it to the United States government, the only instance of the kind on record; and the State of Pennsylvania erected a house in Philadelphia, and offered it as a present to Washington. Here also, a stand was taken against the exactions of Great Britain, in advance of Boston herself. The first opposition to the landing of tea was made at a public meeting held in Philadelphia, December, 1773, some weeks before the celebrated tea party executed its work at Boston.

Last, though not least, should be mentioned the fact known throughout the civilized world, that from Philadelphia came forth the DECLARATION OF INDEPENDENCE.

But the part which Pennsylvania has taken in the great works of internal improvement, evidently needs to be better understood. A thorough investigation of this subject would cause surprise in many quarters, and place the character of our city and commonwealth in a most honorable position.

It is to be remembered that the surface of this State presents an obstacle to internal improvements, greater than is found in any other. Vast ranges of mountains are to be scaled, because there are no gorges through which roads can pass. Rapid and turbulent streams, which are frequently swollen by the rains and snows of the mountains, often carry destruction in their course. Yet the mountains have been scaled by our turnpike roads and substantial and costly bridges have been thrown over the thousand streams. In the extent and cost of her turnpikes, Pennsylvania has long been in advance of all her sister States. The turnpike from Philadelphia to Lancaster, was the first undertaken in the Union, and was completed in 1794, at a cost of \$465,000. Subsequently, the whole surface of the State was traversed by these roads. But the day of turnpikes has passed away, and the famous Conestoga wagons, with their noble six horse teams, whose bells sounded along the mountain defiles, and warned the traveller of their approach, are to be reckoned

among the wonders of Pennsylvania, as it was. From 1791 to 1830, there were expended, in making turnpike roads, in this State, upwards of \$8,500,000, in addition to the sum expended by counties.

The bridges of this State have been accounted one of its remarkable features. The Schuylkill "Permanent bridge," erected in 1798, at an expense of \$300,000, was the first great work of the kind attempted in this country. The first Fairmount bridge, with its span of 358½ feet, outrivalling the famous bridge of Shaffhausen, and the wire bridge erected in 1817 at the Falls of the Schuylkill, which served to suggest the idea to European builders, were an honor to Philadelphia. The bridges in the interior, by their number, and their substantial and even bold character, have done honor to the State.

For the introduction of canals, as well as turnpikes, to the public attention, the country is indebted to Pennsylvania. Even William Penn seems to have meditated on the project of connecting the Susquehanna with the Schuylkill; and in 1762, David Rittenhouse and Dr. William Smith surveyed a canal route for the purpose. At that early day, these gentlemen had in view the connecting of the lakes and the Ohio river with the Delaware, by a route of nearly 600 miles! The survey, under the authority of the legislature of Pennsylvania, was accomplished in 1769. In 1791, a company was incorporated for connecting the Susquehanna and Schuylkill, and in 1792, another was incorporated for connecting the Schuylkill with the Delaware by the way of Norristown. At the head of the latter was Robert Morris, the celebrated financier. These two companies undertook the work, and proceeded with it, when, after having expended \$440,000, they were embarrassed, and suspended operations, a number of the leading individuals having become bankrupt in this herculean effort. These beginnings, however, resulted at length in the completion of the Union canal. The first tunnels excavated in the Union, were in Pennsylvania. The first survey for the Chesapeake and Delaware canal was made in 1768, by order of the American Philosophical Society; and as early as 1804, \$100,000 were expended in the execution of the work.

When the period of railroads arrived, Pennsylvania was again the pioneer. The railroad at Mauch Chunk, constructed with Philadelphia capital, was the first in the Union; or, at least, was anticipated only by a short tram road at Quincy, Mass. From that period to the present, Philadelphia has been second to no city in the Union, in expenditures for constructing these wonderful annihilators of time and space.

The Coal Trade of Pennsylvania is attracting more and more, the attention of the country. No thinking person can contemplate its progress without being deeply impressed with the importance to our Union, of the State in which such vast resources of fuel are found. Were Pennsylvania annihilated, with all her mountains of coal and iron, how melancholy would be the condition of her surviving con-

federates, in regard to these two grand requisites of civilized life.

If the importance of the coal trade is inconceivably great, its progress has been astonishing. Anthracite coal was first used as fuel (on tide water) in 1820, and the total supply then sent to market was 365 tons!—a quantity smaller than that now annually consumed by hundreds of single establishments. We now find a single iron manufacturing company in our State consuming 60,000 tons of anthracite, and 100,000 bushels of bituminous coals annually.

From being regarded a doubtful article of combustion at all, anthracite coal has come to be largely used for domestic purposes, for the production of steam in manufacturing establishments, for propelling steamboats and railroad locomotives, and more recently for the manufacture of iron, for which purpose it is employed on an immense scale. In 1840, there were no anthracite furnaces in full and successful operation. There are now 40 furnaces in blast, many of them of the largest class. Within the last three years 18 rolling mills have been erected, which consume hundreds of thousands of tons of coal annually. This branch of business, so important too in a nation view, is destined to increase rapidly, as the demand for railroad iron increases in almost every section of our country. It is only by collecting details and uniting them, that the extent and importance of the coal trade is made apparent. It has already more than trebled the coasting trade of Philadelphia, and pays, annually, a freight on the shipments coastwise from this port, of more than a million of dollars. If this trade is of such importance in this period of its infancy, what will it be in its full growth?

About the year 1837, a report was made to the government by Major BACHE, of the Topographical Engineers, on the subject of an artificial harbor or breakwater, at Cape May, in which he states that the *insurable interest created by the coal trade passing around Cape May alone, already amounts to more than twenty two millions of dollars per annum*, estimating merely the vessels in ballast coming after it, and the value of the vessel and cargo carrying it to the various ports at which it is wanted. Many of these vessels bring us supplies from the ports they come from, at merely a nominal freight, instead of ballast, plaster, fish, lumber, salt, and other articles required for consumption in the interior, which add materially to the resources of the canals and railroads.

In England, coal appears to have been first used as fuel, about the close of the 12th century. In 1339, Henry III. granted a charter to the burgesses, of Newcastle, to dig for coal; which is the first legal mention of the article on record. As early as 1140, we find among the Leges Burgorum, an enactment giving special privileges to the inbringers of fuel, which is described as being "wood, turves and peats." The English coal trade, which now amounts to forty millions of tons annually, may indicate to us something of what we have reason to predict in our future career.

Perhaps few persons have distinctly considered the aggregate expenditure in the improvements designed to facilitate the transportation of coal from our vast coal fields.—Let us look at some definite statistical account of these operations.

NAMES AND COST OF THE CANALS AND RAILROADS LEADING TO THE COAL MINES.

LEHIGH COAL REGION.	Canals length.	Railroad length.	Cost.
The Lehigh Navigation—Extends from Easton to White Haven, 71 miles, and thence to Stoddartsville, 16 miles—there is an improved navigation.....	87		\$4,555,000
Whitehaven and Wilkesbarre railroad—From Whitehaven to Wilkesbarre with three inclined planes and one tunnel.....	20		1,350,000
Mauch Chunk railroad—From Summit & Room Run mines to Mauch Chunk and back tracks.....	36		600,000
Beaver Meadow Road—From the Beaver Meadows to the landing on the Lehigh canal.....	26		360,000
Hazleton Railroad—To Lehigh canal.....	10		190,000
Buck Mountain Railroad—To Lehigh canal.....	4		40,000
Summit Railroad.....	2		20,000
Total Lehigh Improvements.....	87	98	7,945,000

SCHUYLKILL REGION.

The Schuylkill Navigation—Commences at Philadelphia, and terminates at Port Carbon, (including cost for enlarging to this time.....)	108		\$5,675,000
The Reading Road—Extends from Richmond to Mt. Carbon, with a branch from the Falls of Schuylkill to the Columbia railroad at Peters Island, including cost of locomotives, cars, etc.....	93		11,000,000
Little Schuylkill Railroad—Between Port Clinton and Tamagna, cost \$240,000, and new rails now laying, \$220,000.....	20		500,000
Mine Hill and Schuylkill Haven Railroad—Cost \$430,000—new rails, and 7½ miles extension to Swatara, \$120,000.....	25		550,000
Danville and Pottsville Railroad—Unfinished, and only part in use.....	29½		680,000
Mount Carbon Railroad.....	7		155,000
Mount Carbon and Port Carbon Railroad.....	2½		190,000
Schuylkill Valley Railroad.....	14		300,000
Mill Creek Railroad.....	6		120,000
Railroads constructed by individuals, aggregate.....	70		180,000
Railroads under ground in the mines.....	60		75,000
Total Schuylkill.....	408	357	19,365,000

OTHER PLACES.

Lykens Valley Railroad—To Susquehanna canal.....	16		200,000
Wisconsin Canal—To Millersburg on Susquehanna.....	12		70,000
Swatara Railroad—To Union Canal.....	4		20,000
Lorberry Railroad.....	4		20,000
Total other places.....	12	24	310,000

RECAPITULATION.

Lehigh Improvements.....	87	98	7,045,000
Schuylkill.....	108	240	19,365,000
Other places.....	12	24	310,000
Total.....	207	419	26,720,000

To these must be added the Delaware and Hudson canal, 108 miles long, and railroad 24 miles, cost.....	\$3,350,000
Morris canal, 102 miles long, constructed to carry coal to New York, cost.....	4,000,000
Total as above.....	26,720,000
Grand total.....	\$34,970,000
Total length of canals, 417 miles.	
Total railroads.....	473 miles.

The coal trade gives employment to a very great number of persons. Indeed, nearly all the cost of the article is the result of labor. In its locality it is worth only from 25 to 50 cents per ton; averaging 35 cents per ton.—But in all the operations connected with mining and transportation, a vast amount of labor is employed. We must take into account not only the miners, and the boatmen and brakemen on the canals and railroads, and the hands on board the transporting vessels, and the carmen at the places of delivery, but also the thousands employed at some time, in making the necessary railroads and canals, the locomotives and stationary engines, the boats, etc., etc.

The sums thus invested in providing avenues for the coal trade may be computed;—but the enhanced value of lands, and the property which appears in smiling villages where once roamed the panther and the bear, baffle all our attempts at calculation.

These exhibitions of the extent of the coal trade, and its importance to the Union, lead us to ask whether this interest has not a very strong claim upon the government for protection and encouragement. If not, how could such a claim be conceived of as possible?—What operations can be more intimately connected with the prime elements of national growth and power? What political wisdom can discern the propriety of withholding the protecting power of the government here, unless it be that which denies, altogether, the justice and policy of any restrictions on the disheartened competition of other nations, which is fitted to keep back our own enterprise for centuries?

The proximity of the Nova Scotia mines to the New England States—the immense capital of the British Mining Association—(the present holders of the original grant to the Duke of York) and the facilities they possess for bringing their coal into this country, to the destruction of our own industry, seem to require some legislative enactment in behalf of this important trade.

IMPORTS OF FOREIGN COAL.

The following table shows the imports of foreign coal into the United States, from 1820 to 1846, inclusive:

1821.....	23,129	1834.....	71,626
1822.....	34,523	1835.....	49,969
1823.....	30,433	1836.....	108,432
1824.....	7,228	1837.....	153,450
1825.....	35,645	1838.....	129,083
1826.....	35,665	1839.....	181,551
1827.....	40,257	1840.....	162,867
1828.....	32,302	1841.....	155,394
1829.....	45,393	1842.....	141,526
1830.....	58,136	1843.....	41,163
1831.....	36,509	1844.....	87,073
1832.....	72,978	1845.....	85,771
1833.....	92,432	1846.....	156,853

As early as July, 1789, and soon after the

adoption of the federal constitution, a law was passed laying a duty of two cents per bushel on imported coal. (See pub. doc. page 72.) August 10th, 1790, the duty was increased three cents per bushel. Again on the 2d of May, 1792, the duty was increased to 4½, and on the 7th of June, 1794, to 5 cents per bushel. This duty was continued under all the party changes, until April 27th, 1816, when the duty was changed to 5 cents per heaped bushel. In 1824, May 26th, after our coal had begun to be used, the duty on imported coal was increased to 6 cents per bushel, or \$1 50 per ton. Gen. Jackson, then a member of congress, voting in favor of this duty. In 1842, the duty on imported coal was raised to \$1 75 per ton; but even with this check to its importation, some supplies were brought in, as will be seen by a subsequent statement taken from official documents. By the present tariff, the duty is only about 45 cents per ton on board, and may be reduced to 35 cents.

It thus appears that Washington, Madison, Monroe, Adams and Jackson gave their high sanction to the protection of the coal interest—an interest of the importance of which even those tar reaching minds must have formed a very inadequate idea. Of the use of coal in the production of steam, it is not easy to any what suppositions and expectations it would be safe to pronounce extravagant. In an address lately delivered, Mr. Pierpont indulged in the following illustration:

“It required twenty thousand men twenty years to build one of the pyramids of Egypt. The same number of men might, by the aid of steam, accomplish as much work now in twenty-four hours. Cylindrical boilers are the seven league boots of the country.”

In reference to the use of coal in the manufacture and working of iron, it is pertinent to quote the remarkable language of Mr. Lock, in his Essay on the Understanding, where he says—“Were the use of iron lost among us, we should, in a few ages, be unavoidably reduced to the wants and ignorance of the ancient savage Americans.” And, whether we can fully subscribe to this sentiment or not, we cannot object to the beautiful declaration of the same philosopher, that he who first made use of iron, “may be truly styled the father of arts and the author of plenty.”

Our large table shows the comparative quantity of anthracite coal sent to market from the different coal regions in Pennsylvania, from the commencement of the trade in 1820, to the close of the past year. Nearly all the above returns are official, being obtained by us from the different regions. It will be seen they vary in several cases from the reports of the Miners' Journal, the only paper beside our own that has pretended to keep up original yearly statements of this important trade.

Anthracite coal was first used as fuel (on tide water,) in this country in 1820, when the total supply sent to market was only 365 tons. If we divide the 27 years that have elapsed since coal was first used, into three

periods of nine years each, it will be seen that the total supply from all the mines in the first period, ending with the close of 1828, was 239,845 tons.

Second period ending 1837, 3,829,829 "

Third period ending 1846, 11,549,061 "

Showing the annual average receipts for the first nine years to have been 26,648 tons.

Second period, 454,534 "

Third period, 1,283,229 "

From which it appears that the quantity consumed during the last nine years was nearly three times as large as during the preceding eighteen years.

To be continued.

#### PROGRESS OF THE RAILWAY SYSTEM IN ENGLAND.

Herapath, in his Journal of 17th July, says that "Our last paper (p. 777) will have announced to parties interested in railways, that up to yesterday week, July 9th, 136 railway bills received the royal assent, authorizing the construction of 1,141 miles of railway, and requiring a capital, including iron, of about £26,000,000.

But there were presented in this session of parliament 320 bills; and, up to yesterday week, only about 60 of them have been withdrawn or otherwise thrown out; leaving 260. Consequently, deducting from these 260 the 136 which have already received the royal assent, and we have 124 bills still before parliament, many of which are in an advanced stage towards completion. It is probable that the majority of the 124 will be passed. It all, or nearly all, be passed, we shall then have another batch brought into existence about equal to the lot which have just been fully sanctioned—say about £24,000,000 more, making (with the £26,000,000) the sum of £50,000,000 for railways passed in this session.

If we take the cost of the railways established prior to 1844, as £80,000,000, we shall not be wide of the mark. Then, in the session of 1844, there were sanctioned railways to the extent of—(in all cases including loans as part of capital)—£16,000,000. In 1845, as much as £58,000,000 worth were passed. In last session, 1846, there were about £120,000,000 sanctioned. Adding to these totals, £26,000,000 for the lines just sanctioned, and we find the total capital for railways made, being made, and authorized to be made, amounts to £300,000,000. To this we might also add the £24,000,000, which we expect will be further sanctioned before the close of the present session, making £320,000,000. But we have certainly, within a fraction, £300,000,000, as the capital of the old and authorized new lines.

Of this £300,000,000, by far the major part has to be called up for the construction of the new lines. Only £80,000,000 of it are for old lines. Say that £30,000,000 have already been paid on calls, on account of the new lines. There will, therefore, be £110,000,000 to be taken from £300,000,000, leaving £190,000,000 yet to be subscribed for the new lines. If there should be £24,000,000 more sanctioned in this session, there will be £240,000,000 to be paid up by the public. Per-

haps we may set down in round numbers—not by any means being desirous to exaggerate—£200,000,000, as the amount of future calls.

This result is certainly serious, and demands the deepest attention of all engaged, or interested in railways. With good management, the enormity of such a liability might be rendered indestructive; prudence might even turn it to good account. But if directors go recklessly to work, we cannot answer for the consequences.

If shareholders subscribe £50,000,000 a year in calls, there must be four years consumed in constantly paying up, at this rate, before they (the shareholders or the public) will be released from their liabilities. But it is to be hoped that such arrangements will be made, principally by the present abandonment of a host of almost useless branches, which some of the railway companies have, in their wisdom, armed themselves with power to make, that the payment of the two hundred millions will be spread over a period of more than four years, and thus reduce the subscription in calls to something less than fifty millions a year, or about a million a week.

The sample of management, however, which we now have before us in the table of calls, compiled for us by our correspondent, 'Frank Marvel,' is not at all encouraging. 'Frank Marvel' shows that the amount of calls for this month (July) is £5,227,725;—or more than a million and a quarter per week.!!!

We may observe, passingly, that the table which our correspondent furnishes is as accurate as great labor and unusual means for obtaining such information can make it; and if there is any error, it is that of omission—the real amount must be larger, not less than £5,227,725.

We have no wish to frighten or alarm shareholders, but we really think the above facts demand that they should pay a little more attention to their affairs than it is the fashion to do.

The proverb is, 'It seldom rains but it pours.' Unfortunately at this moment France is in want of a loan of £12,000,000.

By far the larger portion of the £200,000,000 is for branch lines, projected by the established companies. Most of them, we will be bound to say, are next to useless, and will only tend to dilute the profits of companies which are now paying good dividends.—Shareholders have it, therefore, in their own hands, to prevent the enormous expenditure for such lines. They can come to resolutions requiring their directors to suspend the construction of them, by which they will not only save themselves from the ruinous engagements of having to pay calls for years to come at the rate of more than a million a week, but will prevent the threatened reduction of their present dividends.

We have long urged upon railway direc-

\* Since writing the above, 'Frank Marvel' has sent us some corrections or additions to the table of calls, rendering the amount for this month £5,332,725.

tors and shareholders the folly of that wholesale creation of branches and amalgamation, and leases which bid fair to reduce dividends to little, and something beautifully less. Our warning voice has been disregarded. A spirit but little better than madness has been abroad. Line after line has been created—branch after branch has been projected, and boards, instead of being checked, have had all their propositions received with clapping of hands and shuffling of feet, as if they were conferring some everlasting good, instead of tagging to the concerns schemes which must inevitably reduce their value and their dividends. It is now reported that one of our great lines will drop its dividend a half per cent. for the half year at the next meeting. Unless the pruning knife be vigorously applied to the superfluous branches, we shall not at all be surprised to see some of our 10 per cent. lines gradually drop to five and others to less. Shareholders run away with the notion that they can have the premiums and dividends too. They cannot or will not understand, that every addition paying less than 10 per cent. or less than the parent line, must necessarily reduce their annual income. No, a line paying 10 per cent., they imagine will, by a sort of magic, make everything added to it pay the same dividend, and, therefore, will not reduce the dividend of the old line. A very few years, we expect, will teach them better, and open their eyes to the improvidence they have committed in their unrestrained creation of capital.

Many of the branches and extensions, we admit, are not of the several companies seeking, but are forced upon them by circumstances. A restless neighbor thrusts out a branch into their dominions, and to save themselves, they are obliged to project another, or perhaps two, without any regard to cost or returns. As, however, it will not do to tell the shareholders this, the projectors of these branches so contrive to mystify the case with figures and assurance, as to make the barren projects appear to be excellent acquisitions. A high premium, or one proportional to that of the parent company is asked and obtained for the new shares, and the fortunate sellers go their way rejoicing, not dreaming that the very premium, if not more, which they have pocketed for the branch, must, ere long, be taken out of the share price of the old line.

In the majority of cases, however, these branches are not even forced upon the companies by external circumstances, but are the creations of the engineers or solicitors of the companies, or perhaps of both together, or are the creations of a designing, unscrupulous man of influence in the company, who has some interest to serve. Cases have not been wanting where land or an estate has been bought first, and a branch or an extension projected afterwards. There was one instance in which land of the value of £300 was charged to the company by one of the directors, and paid for at £30,000. Nor is this a solitary instance; others equally as flagrant can be adduced; but we hope and believe they are not very common occurrences. Branches, though not unfrequently the crea-

tures of boards, are more generally the offspring of cupidity in certain officials. But come from whatever source they may, the shareholder will do well to have none, or as few as possible of them made. The large amount of capital to be called up, for really necessary schemes, will be sufficient to tighten, if not cripple, the money market, and consequently to depreciate very materially the price of railway stock, without the burden of unprofitable and useless branches. But the new creations in the present year, consist almost entirely of branches and needless extensions. Shareholders, therefore, should insist on their postponement. If they do not, they must expect, ere another year pass over their head, to see their most valuable property reduced some 50 per cent.

We give these remarks entire, as they reprove, with great freedom, the present doubtful policy—in the estimation of many—of numerous branches to the principal main lines of railroad in England.—We like the freedom with which the editor of this Journal often comments upon the policy of some of the companies.

#### CRAMPTON'S LOCOMOTIVES.

The London Morning Herald of July 22d says that "the 8-foot driving wheel engine, (Crampton's) on the working of which great expectations were formed by the narrow gauge party, and the details of a very good performance of which we gave a short time since, has been singularly unfortunate upon the London and North Western line. Although admirably balanced upon her wheels, and of excellent workmanship, hot axles have been a common occurrence with this engine. She got her buffer beam broken, and her axle boxes injured, by most culpable negligence on the part of a driver of a pilot engine.—She was sent with instructions, for slight repairs, into the shed, where she remained much too long a period, considering the important influence her working was likely to have on the question of the gauges. Again, if we are not mistaken, we have ourselves seen several different men driving and stoking the engine in the few trips that she has taken. This change of men is certainly most injudicious with a locomotive having a fire box of a novel construction, and difficult to feed.—Practical people know that the best mode of firing and working such an engine is not to be ascertained either the first or second trip. The engine took a couple of trips yesterday, on the London and North Western line, with ordinary trains, prior to her being taken into the shed to be thoroughly inspected. We rode down the line with her, and, although we think her fire box defective, an evil which can be remedied, we are confirmed in the soundness of the favorable opinion we formerly expressed of her. The fire box when well fed does not afford her all the steam necessary for high velocities with heavy loads. It was pointed out at the time that the remedy was to be found in excellent bearings;—and we learn that in the new engines of this class that have been ordered by various companies, the patentee is adding three feet to the present 14 feet bearings. This addition will enable him to make his fire box of the old

shape. Any stoker will then be able to feed it, and we have no doubt that Mr. Crampton will, with such an alteration, be able to show a very important improvement in the speed and power of narrow gauge passenger engines.

#### ELECTRICITY AS APPLIED TO THE SMELTING OF ORES.

We are given to understand, upon undoubted authority, that arrangements have been entered into for the purpose of fully testing the process lately patented by Mr. A. Wall, for refining and smelting ores by electricity, and that Dartmoor is to be the scene of operations—the Dartmoor Consols Mining Company having, for a limited period, placed the smelting house, situate on their mine, at the disposal of the patentee. We have already made mention of this highly important discovery in a former number, and we congratulate the mining interest on the principle being so near development; and should the result of the experiment be favorable, which we predict it will be, there can be no doubt it will give an impetus to the trade, and a new era will be arrived at in the art of smelting.

We understand the experiments hitherto made, have been on the harder metals—such as iron and steel—and which have been highly satisfactory. The object of the present experiments at Dartmoor is, to prove the great superiority of the electric process on the more ductile metals—such as tin, copper, lead, etc. We cannot, therefore, speak too highly of the liberality of the directors of the Dartmoor Consols Mine, in thus enabling the patentee to show the results in the very heart of the mining district, where these metals are chiefly produced, and which, we understand, he confidently anticipates will be yet more favorable than on the harder metals. Hitherto smelting the ores, raised in the two counties of Devon and Cornwall, has been a trade of itself—the ores being sold at or near the mine and taken to Wales to be smelted; and this business being in the hands of a few very rich individuals, there is not that fair competition that there should be in a trade of such vast magnitude.

To obviate this great evil, which weighs heavily upon those who have a vested interest in mines, as well as on the miner who extracts the ore, has been the anxious desire of many patriotic individuals; but the monopoly has taken too deep a root to be easily removed, and, we lament to say, it still exists in full vigor. By the new process, smelting will be carried on at a much less cost; and we confidently anticipate that furnaces will be erected in localities where the ores are produced, and smelted on the spot, instead of being conveyed at a considerable charge for carriage, freight, etc., as now practised—thus enabling the industrious miner, and the capitalists who invest in mines, to divide a handsome profit, which is now swallowed up by the monopolist; and many mines that are worked at a loss, will return dividends to the shareholders. We hear that a large offer has been made to the patentee by a private capitalist, for the exclusive right of using his patent in the two counties of Devon and Corn-

wall; but he rejected the offer, preferring to allow those locally interested to share the benefits to be derived from his discoveries.—*London Mining Journal.*

#### BARON VON RATHEN'S COMPRESSED AIR LOCOMOTIVE.

In our Journal of the 12th June, we made mention of some experiments which we had the pleasure of witnessing at the College for Civil Engineers, at Putney; which had for their object to test the practicability of Baron Von Rathen's new plan (patented, but still unspecified) of working locomotives by compressed air. We stated that we had seen on that occasion air compressed to upwards of 850 pounds per square inch, and this enormous power was set free again with the greatest facility for locomotive purposes—that is to say, not all applied at once, but "set free" or let off, as wanted, in quantities proportionate to the work performed. We noticed, further, that there was a common road locomotive in the course of building at the work shops of the college, which was intended to be worked on this plan. Since then some additional experiments have been exhibited by Baron Von Rathen; for the following particulars of which we are indebted to an eye witness:

On the 8th inst., the compressed air reservoir was again charged to upwards of 600 pounds per square inch, in the presence of a number of gentlemen, who have associated to make trial of Baron Von Rathen's system; and if that trial prove successful, of which there now seems every probability, to promote its general adoption, both on railways and common roads; and, in order to show the perfect control under which this prodigious force is kept, and the ease with which it may be applied, in more or less abundance, the air was allowed to escape from the reservoir, at intervals, regulated solely by the pleasure of the persons superintending the experiment. The noise made by these successive escapes of air, was like that of a battery of cannon. Another point which remained to be practically demonstrated, was the length of time which the reservoir was capable of retaining a body of air under so high a state of compression; and in that respect also the result was in the highest degree satisfactory. Four days after the experiment just described the reservoir was again tried in the presence of the Duke of Buccleugh, the enlightened and public spirited patron of the college, and several other noblemen and gentlemen—being still in the same state in which it was left on the 8th inst., and reduced only in its original force by the amount of air discharged from it on that occasion. The working power of the apparatus was now found to be for all practical purposes, in as high a state of perfection as ever—the air issuing with apparently undiminished elasticity from its state of confinement, and with a noise that could only be likened, as before, to that of heavy artillery. Of no other motive power yet invented, can it be said that it is capable, like this, of being stored up in any quantity, not only till the occasion arrives for its use, but in a state always fit for instant use; stored up, moreover, in vessels which may be either

stationary, or carried about from place to place. Of no other known power either can it be said with so much truth, that it is unlimited in its source, and free from everything like nuisance in its application.—*Mech. Magazine.*

From the London Mining Journal.

THE AMERICAN STEAMER "WASHINGTON."

*Kymer and Leighton's Fire Bars.*

SIR: I have just read in the Mining Journal of 17th July, a short account of the return of the American steam ship Washington to Southampton, after destroying two sets of fire bars, which you state "a committee of the passengers attributed to the bad quality of the coals—a species of anthracite much resembling the American." I beg to make a short comment upon this. The destruction of the grate bars was owing to the superior quality and strength of Welsh anthracite coal over the American; the latter contains a very large proportion of ash, or earthy matter, which protects the grate bars from the joint action of carbon and the blast. There is but one vein, or seam, of anthracite in Wales which can be used with a blast and common grate bars; this contains about 20 per cent. of ash—that is, earthy impurity. The generality of Welsh anthracite will not average more than four per cent. I enclose you a circular, consisting, for the most part, of extracts from your valuable Journal, in which you will find the analysis of some coal containing only 1.18 of impurity in 100 parts. With such coal as this, I have run a set of bars together in less than two hours; this was owing to the strength of the fuel, not to any inferiority in quality. In order that such fuel as this might be applied to steam navigation, by the use of a fan blast, I contrived a grate having a trough of water under each fire bar. As I have so repeatedly brought this matter before your readers, I refrain from further comment, than merely to state my decided opinion with respect to the Washington steamer. I know nothing of her qualities as a sea boat, but, *ceteris paribus*, referring merely to the generation of steam. Had the Washington gone to sea, fitted with Kymer and Leighton's grate, using the Garnat pig vein coal (some of which I believe was shipped at Llanelli for her use) and an ample blast, no steamer on the ocean would have kept up with her. Although wearied out, and disgusted by the neglect and apathy with which the anthracite coal owners have always treated this plan, I cannot resist the impulse of placing the merits of the case in a true light. T. H. LEIGHTON.

Llandeib, near Llandilo, July 18.

From the London Mining Journal.

IMPROVEMENT IN SIGNALS FOR RAILWAYS.

SIR: Shortly after the very serious accident at Wolverton, on the London and North Western railway, my attention was directed to the principle of signaling generally adopted on railways—the use of different colored flags by day, and different colored lights or lamps by night. This principle, so far as I know, has in general wrought well, and might for some time at least have retained

the confidence of railway proprietors and the public, but for the Wolverton accident, which, in my opinion, may be traced to this very objectionable mode of signaling. It is a well known fact, that many individuals have not the power of distinguishing colors at all; and that, where this defect of vision does not exist, any sudden transition of the eye from one color to another, occasions confusion and indistinctness in determining the color presented to the eye. If these statements are correct, then I think that the confusion and consequent fatal blunder of Fossy are easily accounted for; or should the memory fail for an instant in its power of associating a certain colored light with a particular train, there is nothing tangible left to resort to for its correction. The approaching train leaving but little time for reflection, necessitates a movement of some kind on the part of the watchman, which movement has too often been of a wrong kind, although not always attended with such serious results as the case referred to. What I would suggest is, that each lamp used as a signal, should take the form of a letter, which letter should be significant of the character of the train to which it is attached—for instance, a lamp in the form of a P should be placed on a passenger train, and one of the form of an L for a luggage train, and so on in respect to the other descriptions of trains. The same principle I recommend to be adopted for the signal lights at the different stations. It would then be immaterial what color of light is used, as the recognition of a letter, either on the train, or on the signal posts of the stations would determine the movements of the different parties immediately concerned in the management of the trains. This principle, if adopted, would at once relieve the minds of all connected with the movements of the trains from all embarrassment, arising from defective memory, or disordered vision, as the appearance of a letter, the initial of the thing signified, would be at once tangible to the most obtuse understanding, and give scope for a greater variety of signals than the present system can admit of.

ROBERT BOWMAN.

Co. James' Square, Wolverhampton, }  
July 26, 1847. }

*Fall of Another Bridge.*—On the evening of Thursday last, the bridge in the course of erection over the Tweed at Ashysteel, fell with a tremendous crash into the water. The ruins of it now lie like a vast dam across the Tweed, with only a narrow outlet in the middle, through which the water passes. The whole wooden framework supporting the arch was literally smashed to pieces. No individual saw the bridge fall, the workmen having all left a short time before. Mr. J. Smith, one of the architects, had just examined it, and seen nothing wrong. The cause of the accident is not properly ascertained.—The arch, which was 135 feet span, and constructed entirely of whinstone, was a double one; both arches were finished, and they were putting on the balancing. Some attributed the accident to the haunches or outer ends being overloaded, but this is mere con-

jecture. We understand Messrs Smith have commenced active operations to have it rebuilt this season on the same gigantic scale as at first.—*Border Watch.*

*A Modern Miracle.*—A rope, nearly three miles long, now lies on the verge of the borough of Gateshead, which was the other day a stone in the bowels of the earth! melted, the stone yielded iron. The iron was converted into wire. The wire was brought to the wire rope manufactory of R. S. Newall & Co., at the Teams near Gateshead, and there twisted into a line 4660 yards long. It is, we believe the stoutest rope of the kind that was ever made. It weighs 20 tons 5 cwt. and will cost the purchasers upwards of £1,134. It is intended for the incline on the Edinburgh and Glasgow railway, near the latter city. A rope of hemp, of equal strength, would weigh 32½ tons, and cost about £300 more. It would also entail greater expense while in operation, (owing to its greater weight) and sooner wear out.—*Gateshead Observer.*

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.** Proposals will be received at this office, and at the office of the Resident Engineer, in Gardiner, until the 21st of August, for the Grading and Masonry of 21 miles of this road, extending from Bowdoinham to Augusta.

The line of road and the plans and profiles will be ready for examination on the 12th of August, after which time any information in relation to the work can be had at the engineer's office in Brunswick and Gardiner, or of the resident engineer on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to complete the work.

The remainder of the line from North Yarmouth to the depot of the Portland, Saco and Portsmouth Railroad in Portland, 15 miles, will be ready for contract on the 18th of September, of which due notice will be given. GEORGE S. GREENE,

Engineer K. & P. R. R.

ENGINEER'S OFFICE, K. & P. R. R }  
Brunswick, July 12, 1847. }

233

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

ROBERT GRACIE.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 12 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 3500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

19 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

281f

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**A. & G. RALSTON & CO., NO. 4**  
South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz:  
180 tons 2 1/2 x 1/4 inch Flat Punched Rails, 20 ft. long.  
25 " 2 1/2 x 1/4 " Flange Iron Rails.

75 " 1 x 1/4 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

11f

**THE SUBSCRIBERS ARE PREPARED TO**  
execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

261f

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Vrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1v

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on

an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

**FRENCH & BAIRD.**  
N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

.. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Ewing, Philadelphia; Wm. E. Coffin & Co. Boston.

ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10c

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trelis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trelis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trelis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331f

## LAP-WELDED WROUGHT IRON TUBES

FOR

## TUBULAR BOILERS, FROM 1 1-4 TO 6 INCHES DIAMETER, and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address

J. M. HOWE,

Pres't. Mt. Savage Iron Works,

Dec. 25, 1y\*

Maryland.

below Walnut,  
Philadelphia.

road Depots, etc.

ANDREW MENEELY.

West Troy, May 13, 1847.

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniatta Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

124f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by

JOHN W. LAWRENCE,

143 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 321f

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

# ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ropes; or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

16	2½	4 3	6	8 8	10½	7-16		7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1v24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLCOTT & ABBOTT.

Factory, 9th street, near Contes, cor. Melon st.

Office, No. 3 North 5th street,

Codorus,  
Glendon,  
Spring M.I. and  
Valley,

Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L. KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**RAILWAY IRON.—THE BEST QUALITY** of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2. [1H] 68 Broad St. New York.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.] WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road,

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power

# NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

Reading, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

 A. & G. RALSTON  
 Mar. 20/1 4 South Front St., Philadelphia.

**V**ALUABLE PROPERTY ON THE MILL Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft. with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45½ feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**T**WO LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

MORRIS TASKER & MORRIS,  
 Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 117

## PATENT INDESTRUCTIBLE WATER

**P**ipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 2817

J. BALL &amp; CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7.11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. WALDO HIGGINSON, Agent.

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Wayneville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	\$1 00
" " " Xenia	1 50
" " " Springfield	2 00
" " " Columbus	4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1 1/2 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47th W. H. CLEMENT, Sup't.

**PATERSON RAILROAD**

1st class.—Boxes of Hats, Bonnets and Furniture per foot.....  
 2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cans) Drugs, Confectionaries, Shovel, Spades, Scythes, Smiths' Bellows, Baskets, Tubes, Sifters, Brooms and other light articles, per 100 lbs.....  
 3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheese, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casks, or Crates of Crockery, Hardware, and other heavy articles not enumerated below.....  
 4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Limestone Oil, per 100 lbs.....  
 Per 100 lbs. Cotton.

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.: and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.

Chattanooga, Tenn., July 1, 1847.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1839 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## ENGINEERS and MACHINISTS.

THOMAS PROSSER, 28 Platt St. N. Y. (See Adv.)

J. F. WINSLOW, Albany Iron and Nail Works Troy, N. Y. (See Adv.)

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, September 4, 1847.

### Philadelphia Machinery.

The *Charleston Mercury* contains the following compliment to Philadelphia machinery. The locomotives in use are those belonging to the South Carolina railroad:—

"Our railroad now possesses a number of locomotives equal in power and finish to that of any other road in the country. Among them, the following are particularly worthy of examination:

"From *Norris, Brothers, Philadelphia*.—Eight-wheel passenger locomotive—John C. Calhoun; also six-wheel connected freight locomotive—Cerro Gordo.

"From *M. W. Baldwin, Philadelphia*.—Eight-wheel connected freight locomotives—Atlanta, Buena Vista, Coosa, Wateree, Chattanooga. Also the Rio Grande, six-wheel connected.

"From *Ross Winans, Baltimore*.—Eight-wheel passenger locomotive—Rough and Ready."

### Delphi and Cincinnati Railroad

The stockholders in this company met at the court house in this city, on Wednesday, says the *Chillicothe Advertiser* of Friday last, and it having been ascertained that a sufficient amount of stock had been subscribed to authorize the organization of the company, the following directors were chosen:

Felix Renick, Wm. Ross, Wm. H. Price, John L. Green, John Maderia, W. M. Anderson, of Ross county; Allen Trimble, Wm. O. Collins, of Highland county; Wm. P. Cutler, Noah L. Wilson, of Washington county; A. B. Walker, John Ballard, David Richmond, of Athens county.

At a meeting of the board of directors on Thursday, they organized by the election of Felix Renick president, Wm. Ross, treasurer, and the appointment of Seneca W. Ely, secretary.

## Railroads.

**Eastern Railroad.**—The *Salem Gazette* states that over one hundred and three thousand persons were conveyed over the Eastern railroad in the month of July last.

**Vermont and Massachusetts Railroad.**—A portion of this road, leased to the Fitchburg company, will be opened for freight and passengers on Wednesday next.

**Ogdensburg Railroad.**—The grading, etc., for 60 miles of this road, from Ogdensburg to Malone, is advertised to be let to contractors on the 23d September, at Ogdensburg.

**Lexington Railroad.**—The directors have made 600 shares of new stock, to be taken by stockholders at \$70, payable 15th September, 1st November, and 1st December.

The Northern, N. H., railroad has been opened as far as Grafton, 37 miles from Concord.

**Gloucester Branch Road.**—During the twenty days which this road has been open to Manchester, upwards of 4,000 passengers have been safely transported over the same. This is truly a great beginning, and augers almost unexampled success for the road, when, under complete equipments and arrangements, it shall be opened to Gloucester—an event expected to take place in all the month of October next. We understand that, for the present, Mr. Ebenezer Page, of Beverly, will officiate as conductor on this branch.

**Columbus and Xenia Railroad.**—The Little Miami railroad company, says Mr. Cist, under the authority in their charter to make branches running through any county in which their main line runs, have agreed to make a road from Xenia to the line of Greene county, to meet the railroad from Columbus. This will, of course, facilitate the completion of the Columbus and Xenia railroad at an early date. The rail route from Columbus to Xenia is straighter than the regular stage route between those places.

**The Muscogee Railroad.**—By a private letter from New York of the 19th August, says the *Savannah Republican*, we learn that the Wall street proprietors of the Macon and Western railroad have made their arrangements to run from Barnesville to the Flint river, leaving the connection from that point to the people of Columbus. Messrs. Cooper and Stroup will, it is said, furnish the rail at seventy-five dollars per ton, and take a portion of the stock in payment.

**The Fifth Dock** of the Schuylkill Navigation is now in use, although not fully completed. It was erected under the direction of the superintending engineer of the company, Elwood Morris, Esq., and is a noble and substantial structure. While it is durable, it also presents facilities for shipping any amount of coal that may be required without inconvenience or delay.

## Influence of Railroads.

A short time since, says the *Concord, N. H. Journal*, we met a heavily loaded team a little distance from town carrying chestnut sleepers to the depot. Being of a peculiar shape, we inquired to what use they were to be appropriated. The teamster replied that they were engaged by a contractor, and were to be shipped to Havana, to build a railroad in the Island of Cuba! Concord chestnut, once nearly worthless, now bringing a high price, and shipped 2000 miles to build railroads! We believe the teamster's load was worth about \$50, all clear gain through the magic influence of railroads.

A respectable citizen of our town, once resident in Springfield, on the dreary height of land between the Merrimack and the Connecticut, near which the Northern railroad is to pass, lately informed us he had tried long and earnestly to sell a lot of timber land for \$4 per acre, but all in vain. Not long since some gentlemen called upon him, and offered \$16 per acre, which he accepted, though he might have done better by waiting. This is by no means a solitary instance. They are of frequent occurrence in every part of the country.

## Railroad Scales.

Messrs. F. H. Benson & Co., of Cincinnati, says the *Times*, have manufactured a railroad scale which will weigh 40,000 pounds, and yet turn with the fraction of a pound weight. These gentlemen have become noted for their skill in the manufacture of all kinds of scales, from the apothecary's counterbalance, to the enormous instrument first mentioned. Success attend our western manufactures.

**ERRATA.**—In the last number of the *Journal*, page 550, under *Lehigh Coal Region*, the figures (20) for the miles of the Wilkesbarre and White Haven railroad, are placed in the wrong column—being under the head of canals.

Also same page, middle column, third line from top, read \$3,250,000.

**Railway Traffic.**

"From our official returns," says the Railway Chronicle of July 31st, "It appears that the amount of traffic for the last week, on upwards of 3,153 miles of railway, was £188,824, thus accounted for: £108,606 for the conveyance of passengers only, £40,476 for the carriage of goods, and a remainder of £39,742 for passengers and goods together, not respectively apportioned; being an increase of 16,175 over the corresponding week of last year, when the mileage was about 2,290."

**Coal Trade.**

We have been furnished with the following statement of the coal sent to market by the Schuylkill canal—which we shall publish as furnished weekly.

**SCHUYLKILL NAVIGATION.**—Week ending August 26th, 1847.

	Tons. cwt.
Pottsville and Port Carbon.....	5,624 01
Schuylkill Haven.....	594 06
Port Clinton.....	33 00
This week.....	6,253 07
Previously.....	121,956 14
Total.....	128,210 01

From the Philadelphia Ledger.

**New Railroad.**

The vast increase of tonnage annually requiring conveyance from our coal fields, and the success that has attended the Reading railroad, seem to awaken the capitalists of New York and Boston to the probability that there may be business for more improvements connected with the coal trade. At the present rate of increase, there will be perhaps two millions of tons more requiring means of transport in five years from this time. The Eastern papers inform us that the stock has been recently taken for the construction of a new railroad from Easton along the valley of the Lehigh, to the Schuylkill coal field, branching off to the Lehigh and the Pottsville mines, and also to the Susquehanna, via Tamaqua. From Easton to Somerville, N. J., the road is in progress of construction. From the latter place to the New York bay at Elizabethtown, it has been long in use.

When we look at the great number of canals and railroads, all well supplied with work, that are necessary to do the carrying trade of the mines of England, which are of less extent than ours, we feel entire confidence in the success of every avenue leading from our Schuylkill coal basin to tide water.—The Lehigh canal, the Delaware Division, the Morris canal, the Schuylkill canal, the Reading railroad and the proposed railroad across Jersey.

**The Iron Trade.**

We learn from the Mining Journal of 7th August, that railway bars remain about the same as at the last arrival, viz: £9, average, though "the export demand for Welsh bars improved in past month, and the lowest price is now £8 10s. in Wales, but some will not sell under £8 15s. Staffordshire prices continue firm, and the demand for hoops has lately been unusually large. Scotch pig has advanced 5s. to 7s. 6d. in the last four weeks. About the middle of July, a large business was done, but for the last fortnight transactions have been limited. The strike of the men is partially over, and it is expected that those who are still out will soon resume work at the proposed reduction of wages. Some recent arrivals of Swedish iron have been sold at £11 5s., but of steel no sales are reported."

"An improvement," says a correspondent of the same Journal, "of 5s. to 7s. 6d. per ton has taken place in Welsh bars since last month, and a consi-

derable business has been done both for exportation and home trade at the advanced rates. So full are some of the makers with orders that they cannot undertake to execute contracts before October next. Railway bars continue exceedingly dull. Staffordshire manufactured is still in fair demand, and makers are realizing full prices. Scotch pig iron has slightly advanced since last mail, owing principally to the strike of the men, and the small quantity in second hands. Staffordshire pig is in good demand at firm prices, but Welsh appears rather neglected. Swedish iron has been taken in small parcels at £11 5s., at which there are still sellers. Swedish steel remains flat at £15."

**The Great Canada Railroad.**

The Albany Evening Journal says that the railroad, so long talked of, from Hamilton to Detroit, is to be built. This is a fixed fact. The surveys have been made, the route located, and next month, 170 miles will be let out by contract. The road is to run from Hamilton to London, and from London to Windsor opposite Detroit—a distance of about 200 miles. The original route was to Port Sarnia, 60 miles above Windsor; but a compromise has been affected, and a branch is now to be run from a point 13 miles west of London to Sarnia. This satisfies the original projectors of the route from Fort Erie to Windsor, and also the Canada Land company, and others most interested in the route from Hamilton to Port Sarnia direct.

Although nominally running from Hamilton west—the principal track, in which American travel is interested, will start from Niagara Falls, at the point selected for the suspension bridge—the entire stock for which is already subscribed.

There can be no longer a reasonable doubt that the road will be built within three years. When finished, the trip can be made from the Falls to Detroit in 10 hours—a very great improvement upon locomotion, even in Summer, and in Winter to an extent only to be appreciated by those who have performed the weary journey.

In connection with this road, the road from Lockport to Rochester is projected. Its friends are making renewed efforts to fill up the stock. We are informed that the work will be placed beyond a contingency when \$200,000 additional stock is taken. But whether this is so or not, when the Canada road is built, the Rochester and Lockport road will be undertaken.

This Canada road is of vital interest to our own thoroughfares. When completed, it will draw immense travel in this direction, which now seeks other channels. It is but a link in the great chain to St. Louis. We may regret that it is to be first built through a foreign territory: but enterprise and commerce are making of "one blood all nations of the earth."

**Frankfort and Louisville Railroad.**

We are pleased to learn that "on Saturday, the 14th ult., the stockholders of the Frankfort and Louisville (Ky.) railroad met according to a call of the commissioners, for the purpose of electing directors for the ensuing year. It appeared that there were over 3500 shares taken, and nearly all was represented at the meeting. Whereupon C. Coleman, V. McKnight, J. Guthrie and W. H. Field, of Louisville; T. Smith, of Newcastle, and J. Swigert, were elected directors for the ensuing year. At a meeting of the directors on Monday, 16th, C. Coleman, Esq., was elected president of the company, and steps were taken to have an immediate survey and estimate made."

From the spirit evinced at the meeting, as well as by those interested in the construction of this road, we are induced to believe that the work will now be pushed on to an early completion.

It will be recollected that the people of Lexington and Frankfort, Ky., were among the early movers in favor of railroads. By referring to the "Table of Railroads in the United States," column d, it will be seen that the "Lexington and Ohio" railroad, or a part of that proposed road—28 miles—from Lexington to Frankfort, was opened for use in 1835—the same year that the Boston and Lowell, Boston and Worcester, and Boston and Providence roads in Massachusetts, were opened. Yet, unfortunately, those who took an active part in that early movement, were far in advance of most of the people in that, as well as most other, sections of the country, and were not sustained in their efforts; and when the road was opened from Lexington to Frankfort, the cost was so much beyond their expectations that the work was suspended; and, until recently we believe, little effort has been made for its extension to the Ohio river—although that part of the road which has been in operation since 1835, has been of comparatively little use to the public, and less to the stockholders.

It has, however, been leased out for several years to a company of gentlemen, of whom the late lamented Col. W. R. McKee—who fell fighting so gallantly, at Buena Vista—was one. He had the management of it, we believe, and had he lived, he would probably have been one of the most active in the work now under consideration; as we recollect well the interest he took in it, in the summer of 1845, when on a visit to New York. But, like a true American, as he was, when the call of his country reached him, he was second to no man, but among the first to offer his services—and with his brave companions, who made him their leader, he sought the post of danger, which proved to him—and many others of his gallant band—the post of honor and of death.

**Schuylkill Navigation Company.**

We received, in May last, a copy of the annual report of the President and managers of this company to the stockholders, at the close of their last years' operations; but by some means it got into the wrong "pigeon hole," and thereby has been sadly neglected. We are the more particular to account for this omission because we published at length the report of its near neighbor and rival, soon after its appearance.

From this report it will appear that an amount of labor was performed upon this work, almost unparalleled in this country, and at times, under the most discouraging circumstances. There are few men, if any, in the country, who could, under the circumstances—the market value of the stock of the company being at little more than half its par value, with a powerful rival work along side getting into successful operation—have accomplished what the president of this company has done. "But," as he says in his report, after enumerating the difficulties to be overcome, "nevertheless, the great object has been accomplished in a substantial and satisfactory style."

The capacity of the canal is now about three times as great as it was the year before—and nine times as great as when originally opened to the trade. The locks are 18 by 110 feet, and will pass boats carrying 180 tons.

The amount of business done thus far on the canal, since its completion, has not equalled, as we understand, the anticipation of some of its friends.

This disappointment arises, we apprehend, from a want of the conveniences and connections between the canal and the mines. The landings, or means of discharging coal from the cars into the boats was formerly owned by individuals, or companies, and not by the navigation company, and it was probably desirable to the latter company that a similar arrangement should again exist—but since the completion of the Reading railroad and the use of that company's cars, the operators have been relieved, to a great extent, from that expense, and they were, of course, not very desirous to incur it again, and therefore, there has been, up to the middle of this month, at least a want of landing room, or place for boats to take in coal. The navigation company has however taken very efficient steps to remove this difficulty—by the construction of spacious docks, and every convenience for discharging coal into the boats. They have also furnished an ample supply of cars to accommodate the business between the mines and the boats—thus placing the operators, who send by the canal, on the same footing with those who send by the railroad, in this part of the business.

Being on a visit to the coal region a short time since, we examined with some care, the work of the "enlargement" between Port Carbon and Schuylkill Haven, a distance of several miles, which we found to have been done in a substantial manner, and the "docks" in course of construction at "Port Carbon" and "Mount Carbon" will, when completed, be creditable to the company—and the engineer, Elwood Morris, Esq., and afford ample accommodations for a very large business.

It was our wish to have examined the enlargement generally, but such are the habits acquired by the rapid movements upon railroads, that no man has patience to waste his time upon a canal unless he is obliged to, especially when the accommodations are only those of a "coal boat"—even of the largest dimensions—we, however, saw enough of the work to be satisfied that there will be a large business done upon the canal again, when the company shall have completed their arrangements for its accommodation. We were also convinced more fully, if possible, than heretofore, that there is no necessity, or cause, for controversy between the two rival companies, now contending for the business of the Schuylkill region, as it will be impossible, or at least very difficult for them both, without very much increased facilities, to meet the demands upon them for the next five years. Why not, then, now come to an amicable arrangement as to the charges for transportation on each? The coal consuming community, which has been so largely benefited by these works, and which owes so much to the capitalists who have constructed them, will cheerfully pay prices that will give a fair return upon the investments—large as they are—and it is only necessary for the managers of the two works to agree upon fair, remunerating rates, and thus make their immense outlay of capital beneficial to all, those who have invested their capital, as well as those who use the articles transported at the very lowest rates ever known.

It may be deemed impertinent in us to suggest and urge this policy upon the two companies; yet we cannot hesitate to repeat what we have often before suggested, inasmuch as we consider it not only for the interest of those who have invested such an enormous amount of capital to accommodate the coal trade, but also just to those who have been so largely benefited by that outlay in the cost of fuel.

We have occupied more space than we intended

when we took up the pen to simply introduce and commend the following report, which we ought to have laid before our readers months ago. It will, however, be read, even now, with interest by those who have not yet had the opportunity.

The following is a list of officers and managers for the year 1847, viz.—

*President.*—Charles Ellet, Jr.

*Managers.*—Thomas Firth, John Sergeant, Jacob G. Morris, John C. Cresson, William E. Hacker, Samuel W. Lippincott, Thomas Williamson, John W. Claghorn, John R. Worrell, Charles S. Wood, James R. Greeves, Eli K. Price.

*Treasurer and Secretary.*—Claudius Harper.

*Report of the Managers to the Stockholders of the Schuylkill Navigation Company, January 4th, 1847.*

It is the duty of the President and managers to submit to the stockholders a report of their proceedings for the year which has just closed.

On assuming the labors of the responsible trust which was confided to them, one year ago, the Board were conscious that the affairs of the company had approached a crisis, which would call for the exercise of all their perseverance and fortitude. A great work had been commenced, which they were expected to complete with unprecedented rapidity, while the credit of the company had suffered under the influence of a remarkable competition, and the misrepresentations of hostile interests.

But that work was designed to open the way to the richest trade which this country offers to persevering enterprise, and they embarked in the labor with undoubting confidence in the issue.

They have now to congratulate the stockholders, that the first great object is attained, and that they possess an improvement ready to do its part in the competition about to ensue for the anthracite trade of Pennsylvania, and that they may look forward confidently for a speedy return for their outlay, and full remuneration for the labor which the work has cost.

On entering upon the duties of the year, the Board became convinced that the contracts which had been let, would greatly exceed the available means in their hands.

These contracts they were bound to fulfil, although but few of the contractors had taken any efficient means to fulfil their engagements with the company.

The old locks were torn down, and the greater part of the navigation was destroyed, while materials sufficient for the new locks were in few places provided, and, in many instances, neither stone nor timber was on the ground, and no preparation had been made for the work.

There were 71 locks and 11 guard gates to be built—of which more than two thirds were to be raised from the foundation; nearly all the culverts were to be lengthened; more than 150 bridges, and 26 or 28 dams to be raised; and all the pools to be cleansed and deepened.

About 40 of the lock foundations were yet to be laid in the river; the river was covered with ice, and there were few boats or scows

in the adjacent pools with which to transport the necessary materials to the work.

A brief review of their position satisfied the Board that there was but one course to be pursued, which could lead to safety and success—the bold course, which the general opinion of the stockholders had marked out, and which had been expressed in a resolution—to carry the whole work on to completion, in the face of these physical difficulties, as rapidly and as thoroughly as possible.

They accordingly proceeded at once to raise the necessary funds, and put the enlargement of the canal itself under contract—to man the new sections with all possible expedition—to augment the force on the work in actual progress—to relet, or place under competent superintendents, the abandoned locks, and to accumulate a force sufficient to complete the whole work, as they vainly hoped, in time to participate in the trade of the year.

But impediments intervened which baffled their efforts, and disappointed their well-grounded expectations.

The immense demand for labor in the coal region, on the line of the improvement, and in the repair and reconstruction of a neighboring work, gave rise to frequent turn outs among the hands, and rendered it impossible to obtain a greater force, at any one time, than about 4000 men.

The mechanical labor of the Schuylkill valley, and the adjacent country, was absorbed by this extraordinary demand; and an adequate number of masons and carpenters, with all the exertion the Board were capable of making, could not be raised to carry the work forward with a rapidity commensurate with their wishes.

To add to their embarrassment, the close of the winter proved to be unusually inclement, and the operations were frequently suspended by heavy snows, the melting of which, in the month of March, produced a freshet in the Schuylkill, and adjacent waters, of great violence and destructiveness.

The new works, in their unfinished state, were necessarily exposed, and being swept by the flood nearly the whole length of the river, were seriously injured at many points. The coffer-dams gave way before the weight of water, some of the foundations of the locks were torn up, the half finished pits of others were filled or destroyed, and the new banks were burst through in numerous places.

The works were re-commenced by the time the water had subsided, and the injured points were pressed with renewed exertion, in the expectation of yet overcoming these additional causes of delay, and gaining a part of the season's trade.

This hope was also disappointed. The water continued generally high for some weeks, and frequent small freshets occurred—such as would have been of little importance at ordinary times,—but still sufficient to overflow the coffer-dams, and produce much inconvenience in the conduct of work requiring the excavation of rock and earth, and the building of walls on the bottom of the river.

This state of things continued, with little

interruption, until the middle of May, when another fresh, equal to the first in violence, swept over the works, again destroying many of the coffer-dams, tearing out the foundations, and even the masonry of several of the locks, and sweeping off portions of the enlarged canal which had been twice completed.

After this occurrence, it became apparent that many of the contractors, who, it had been hoped, might yet finish the work which they had undertaken, could no longer be depended on for the fulfilment of their engagements.

The Board were accordingly compelled to enter upon nearly every difficult job; to engage superintendents, to build shanties, organize forces, and complete the work by the day.

This procedure—the only alternative that remained for their adoption—brought with it its own embarrassments. But, nevertheless, the great object has been accomplished; not, it is true, at as early a period as they had contemplated; not as soon as the great interests of the company rendered desirable; but in a substantial and satisfactory style, and with a rapidity which admits of no parallel in the history of the internal improvements of this country, if it has any parallel at all.

The capacity of the navigation has been made nearly three times as great as it was the year before, and nine times as great as that of the improvement when originally opened to the trade—an improvement which, as is still remembered, required ten years of laborious exertion on the part of the predecessors of the present Board, and ten years of patience and fortitude on the part of the original stockholders.

But in this year of intense application, we have been cheered by the prospect of secure, speedy and ample remuneration; by the certainty of enjoying a sufficient share of a vast and rapidly increasing trade, which we were preparing to convey to a wide spread market by the cheapest possible means of inland communication. *THEY*—our predecessors—had nothing but the speculations of their own prudent intellects to guide them.

They ventured to hope that *thirty thousand tons of coal per annum* might possibly pass over their line to market; we know that the Schuylkill mines now yield a million and a quarter of tons, and that some hundreds of thousands more are kept back for want of the means of conveyance, while the annual increase may now be set down at nearly ten times the value of their estimated trade.

To stand firm in their trials, required manly fortitude: to doubt with the prospects which we have before us is to lack capacity to judge of visible truth.

It is not deemed expedient or necessary to enter into all the details of the operations of this laborious year. It may suffice to say that the navigation has been increased from a canal of very irregular and contracted surface, to one averaging more than 70 feet in width; from a depth of 4 feet to nearly, if

not quite, 6 feet; and from a capacity to carry boats of 60 tons, to a capacity for boats of not less than 180 tons burthen. (See note 1.)

That 71 locks, (none less than 110 feet long by 18 feet wide,) and 11 stop gates have been built:

That 25 culverts have been lengthened, and 4 new ones built:

That 10 aqueducts have been raised, improved, and strengthened:

That 82 bridges, with their embankments, have been raised, and 74 new ones, of various descriptions, have been built:

That 22 dams have been permanently, and some others temporarily raised, and that 5 have been lengthened out so as to vent the floods of the river with more certainty:

That all the pools have been more or less deepened, and nearly all the old channels thoroughly cleaned out; and two entirely new channels cut for the river:

That divers new guard banks have been made, and many of the old ones raised and strengthened, for the better protection of the works:

That new sluices have been put in many of the dams, for the purpose of facilitating the future cleansing of the channels:

That 18 new waste weirs have been built, and 13 old ones raised and improved:

That the tunnel has been widened and enlarged, many of the towpaths have been raised, and new basins cut and walled, for the accommodation of the miscellaneous trade:

That 6 new lock houses have been built; the bottom and sides of the canal, in the worst portions of the limestone formation, have been lined with plank, and that buoys, floating or fixed, have been set in all the channels of which the navigation is at all doubtful:

That surveys have been made of all available streams which furnish sites for reservoirs, and several of the most valuable sites have been secured by purchase:

That ground for new landings has been secured, and the work of construction commenced:

That 120 boats and scows, and 150 additional cars have been constructed, and delivered to the company.

These are the things which have been accomplished: the labor which they have involved can only be appreciated by those who have witnessed or participated in it.

In the month of April, the engineer originally appointed to aid in conducting the work, tendered his resignation to the Board, and it was accepted.

The upper division, extending from the Girard outlet to Althouse's, 31 miles, was laid out and skilfully executed under the direction of Elwood Morris, civil engineer.

The next division, reaching from Althouse's to the outlet of the Girard canal, was placed under the general superintendence of Antes Snyder, civil engineer.

The completion of the upper portion of this division is mainly due to the skill and experience of Samuel Griscom. The lower portions were urged forward by several officers, with great diligence and devotion.

The work on the lower division, extending

from the Girard outlet to Fairmount, was conducted with indefatigable labor and attention, by James F. Smith, civil engineer.

To the skill and zeal with which Messrs. Morris, Griscom, and Smith have carried out the views of the Board, the company is much indebted for the rapid and substantial execution of the work.

The Fairmount lock was first prepared for the trade, and opened for the passage of boats on the 4th day of May.

The navigation was further opened, for small boats, as far as Phoenixville, on the 29th June, and for large boats as far as Reading, on the 11th September.

Large boats were able to pass throughout the line, from Port Carbon to Philadelphia, on the 16th of November.

Several small steamboats ran regularly and successfully on different parts of the navigation, as soon as the large locks were open, and some trips were made by them towards the close of the season with entire success, to Pottsville and Port Carbon.

The most heavily laden boat that descended during the year, conveyed 160 tons of coal, and drew 5 feet water; but there was a sufficient depth in all parts of the work to have passed the same boat with more than 180 tons.

Other boats descended with 130 and 140 tons, drawn as the old boats usually were, by two horses, and managed by three men.

It is fortunate for this company, and for the public interest, that, during the interruption of the navigation consequent on the prosecution of these extensive works, the trade of the coal region has continued its development, without suffering any very serious embarrassment. The trade of the Schuylkill navigation has been maintained by the vigorous exertion of a neighboring work, until the completion of the enlargement will enable this company to resume its legitimate business.

The details of the cost of this improvement, and an exposition of the company's financial affairs, will be exhibited in a sheet prepared by the treasurer, and appended to this report. (See statements A and B.)

It may, however, be here stated, that the aggregate investment of the company, on the first day of January, in stock and loans, including all ascertained liabilities of every description, as well for the construction of the work as for boats and cars, damages and real estate, amounted to the sum of

\$5,655,667 80

To this must be added for known liabilities, of which the amounts are not precisely ascertained, payable in bonds and cash, about

127,000 00

Making for the present aggregate investment,

\$5,782,667 80

There are yet some matters in litigation, and certain claims for damages to real estate, which have not been settled, the value of which, though not great, cannot be correctly estimated. (See statement C.)

TARIFF OF TOLL.

On the opening of the lower division of

the navigation as far as Phoenixville, in the month of June, a tariff of toll was adopted, which differed in its arrangement essentially from those in general use on other public works.

It has been the custom on canals and railroads, both in this country and Europe, to charge a certain established rate per ton per mile for the use of the improvement—not from any evidence that has ever yet been adduced that such a tariff is founded in justice or good policy—but, apparently, because that arrangement had been prescribed without much reflection, in the early characters of British canals, and has been subsequently imitated by those of later date in Europe and America.

In the tariff adopted by this Board, an attempt has been made to tax every article with due reference to the particular circumstances under which it is placed.

They do not fix on a rate of charge which is to increase blindly with the distance, because they cannot perceive how the ability of an article to bear taxation can possibly increase in proportion to the distance it must be carried.

The further an article is transported on the navigation, the greater is the sum which must be paid for freight; and the higher the sum paid for freight, the less, apparently, can the article bear to be taxed for toll. It would seem to be very unjust, then, to increase the charge for toll, precisely as the ability to bear the charge diminishes.

The producer of any cheap commodity above Reading, would be compelled to pay nearly four times as much freight for sending his property to Philadelphia, as the person who produces it at Plymouth. It is certainly, then, very unfair to make the same party pay four times as much toll also.

It is unjust, when the cost of freight amounts almost to a prohibition, to fix such a charge for toll as will make the prohibition perfect.

The only visible object that could be designed by establishing such a tariff, after its effect had been once perceived and appreciated, would be to secure the exclusion of the distant product—a policy which is certainly both unwise and oppressive.

But, admitting that a company may with propriety overlook the claims of justice and fair play, it is impossible to overlook the fact, that by excluding the distant product, and cutting off a source of trade, they diminish the revenue of the institution.

It might, indeed, be argued, that if the distant producer can afford to pay a given charge for toll, the nearer producer, under similar circumstances, and relieved of the extra cost of freight, can certainly afford to pay the same charge; that, in strict justice, the nearer a producer is to the market, the higher is the toll which his property will really bear; and that, so long as it is not taxed higher than that of his more distant competitor, he should consider himself the favored party, and offer no complaint.

It is for the company, whose duty it is to adjust the charges, to look to the circumstan-

ces of other lines, and so regulate the tolls as not to force the trade into the hands of rivals.

Although the season was very far advanced when any portion of the work was open to the trade, the Board have had sufficient opportunity to recognize the correctness of the views which led to the adoption of the present tariff, in the results already obtained.

The proceeds of every office below Reading exhibited a marked, and most satisfactory improvement over the corresponding periods of previous years; and the amounts both of the ascending and descending miscellaneous tonnage, show an increase, during the period the canal was open, which sufficiently demonstrates that the trade is receiving adequate encouragement to insure its future wholesome expansion. (See statements D and E.)

To be Continued.

#### Railway Accidents in England.

##### Long-Boiler Engines Running off the Road.

We find in the Railway Record, for 31st July, the following communication, in which it is contended that "long-boiler engines" are probably the cause of many accidents. It being a subject in which so many are deeply interested, we give it a place in the Journal for the purpose of calling attention to it:

SIR: As an adjourned inquest on a recent fatal case of running off the Brighton line is to be held on the 3d of August, I shall feel obliged by your insertion of the following note in your paper, of Saturday.

Those of your readers who are familiar with the history and progress of the locomotive engine during the last eighteen years, must be aware of the great fact, that the engines manufactured by Messrs. R. Stevenson & Co., up to about the year 1843, were rarely, if ever, known to run off a line, even when both the engine and road have been in but moderate order; and, moreover, that the engines made by various other makers, in imitation (or nearly so) of those introduced by Mr. Stephenson up to about the year 1843 were very nearly as successful in keeping on the road, and therefore it may fairly be considered, as proved by some fourteen years' experience, that certain constructions are very safe; and the writer was recently told by a gentleman connected with Messrs. Sharp, Brothers & Co., of Manchester, that whenever at liberty to do so, they still make their engines on the general form in use prior to 1843; and both they and other parties have, up to the present time, made engines of that construction, with the same satisfactory results as before, and with as much speed, with as much force, and with as much at least, if not more, economy in working than the modern long boiler engines. The Brighton company know this to be a fact from their own experience.

The reader will probably ask, how then is it that the long boiler engines have been so powerfully supported on so many lines of railway? I believe that it chiefly arises from two causes: First, the great influence of anything introduced from that quarter is not very easily to be set aside in consequence of its extensive connections with most of the leading lines, and the numerous and influential

train of confidence by which it is in most cases so deservedly supported, both by directors, officers, etc. Secondly, the general arrangement of the long boiler engine makes their construction much less expensive, and much more profitable to the manufacturers, the price obtained being about the same as for engines of a safer construction; and hence the majority of engine makers recommend them when they have a chance of doing so successfully; and before those combined influences are checked, it will probably require six times the loss of life and property now sustained by the long boiler engines running off nearly every line upon which they have been introduced, before the matter will assume sufficient importance for such a sifting inquiry as will cope with, or effectually check the influence which is still continuing and forcing that class of engines into public use.

Formerly it was considered—and soundly considered, too—by Messrs. Stephenson's party, that the less projecting weight there was over the axles, the safer the engines were; and even contended that the little extra projection of the extreme part of Mr. Barry's circular fire boxes was a serious objection, as it not only gave a greater motion and leverage to the projecting weights, but the force of such motions being governed by the square of the velocity of action, the matter was still more important, and led to the very general adoption of a third pair of wheels behind, as larger fire boxes became introduced. A view of that class of engines as made by Messrs. R. Stevenson & Co., until 1843, is given in the 89th plate of "Tredgold on the Steam engine," where the distances between the wheels, as compared with the extreme length from the front of the smoke box to the hind end of the fire box, is in the proportion of 10 to 13; while that of the long boiler engines are about 10 to 19, and hence the square of their lengths are as 169 to 361, or about 113 per cent. increased power of projecting weight to force the engines off the rails, when once put in action by the working of the engine, or from a little irregularity in the road. And it is no matter of surprise that long boiler engines should be found running off the line every now and then;—but that with such important odds against them in the principles of construction, the forces tending to twist the engine off the rails being increased so nearly up to the power of resistance of wrought iron, that when the irregular motion of the engine exceeds a certain point, the iron rails in most cases have proved no longer able to bear the excessive pressure of the wheel flanges against them, and have been fairly crushed off in splinters by the rounded and blunt surface of the flanges. The strength of rails and fastenings of the chairs which stood well with the construction of engines made up to 1843, have been found decidedly too weak for the motion of long boiler engines; with the latter class, I have frequently seen the vertical action between the engine and tender ranging from four to eight inches upon new roads, which, with an old steady engine, were freely pronounced both by the present and late

inspector general, as quite fit for public service.

For the purpose of urging the contractors to keep the road in better order on different occasions, I selected the long boiler engines for the purpose of pointing out, and magnifying to them, the imperfections of the road, which the long projecting boilers of that class of engines enable them to do to a dancing extent, which the former class of engines were altogether incapable of. And in attempting, and that successfully, to reduce in some degree the vertical action of the front and rear of those engines, some of the front and hind springs were reduced to very nearly the length used in Mr. Stephenson's, when they were not in the habit of running off the road in the manner long boiler engines have so repeatedly done. In the 89th plate of *Tredgold*, before referred to, the length of the front and hind springs are each twenty-six inches, and in reducing the length of some of the weak springs of the front and hind shafts of the long boiler engines, from three feet to twenty-four inches, it will be seen that I was adhering very closely to a good established practice as to length; and in engines projecting as extensively as they do, both over the front and hind axles, it is well known from experience, that much stronger springs are necessary than when the projection of the weight is moderate, as in Mr. Stephenson's former engines; but Mr. Winter, the young gentleman who has given it in evidence that he is the superintendent of Mr. Stephenson's patent engines, and that in his opinion the shortening of the springs was the cause of the engine running off the road, has not had much experience in such matters; and this may in part account for such an assertion.—The circumstance of his being too credulous to be believed, may further account for such an opinion. At any rate, the fact of that young gentleman being unfortunately too careless to be correct, may altogether account for an opinion so much at variance with not only their own drawings and experience, but with that of the whole country. The 'White Horse of Kent,' an engine made at Mr. Stephenson's establishment, went off the Dover line with long springs; and the numerous other long boiler engines which have gone off the road on the Eastern Counties', Great North of England, Hull and Selby lines, etc., since their recent introduction, had all of them long springs. By what sort of a side wind were they sent off the road? Certainly it was not by having short springs; in fact, such a shallow pretext as that of short springs only shows how hard the party are driven to throw dust in the eyes of the jury, if by any means they can be shuffled off from instituting a searching comparison between the extreme length of the boiler, and the distance between the front and hind wheels in engines which proves to the present day to keep on the road at any speed, as compared with the long boiler engines, which have frequently been running off the line—bursting out the chairs, and bending the rails of nearly every line they run upon.

Altogether the long boiler engines differ so materially, and are so opposite in principle,

to the excellent engines formerly made by the justly celebrated gentleman whose name they bear, that nothing but the most positive proof to the contrary will induce me to believe that they are the production of Mr. Robert Stephenson's long and extensive experience, or of his great scientific and practical knowledge.

J. GRAY.

*Gray Friars, Chester, July, 20, 1847.*

#### Menai Straits—Tubular Bridge.

The following remarks of General Pasley, late Railway Commissioner of England, in relation to this work, may be interesting to some of our readers, and we therefore give them a place.

*The Britannia Tunnel Bridge.*—As it is well known, that when examined before a select committee of the House of Commons on the 6th of May, 1845, on the means of passing the Chester and Holyhead railway over the Menai Straits, I approved of the tubular bridge then proposed by Mr. Robert Stephenson, engineer of that company. I think it a duty to myself, if not to the public, to offer some observations on the various projects for effecting the same object, successfully brought forward by him, of which that aluded to was the second.

In the first plan, which had previously been referred to me officially, by desire of the Earl of Dalhousie, in the month of February of the same year, when I had two interviews with Mr. Stephenson on the subject, he proposed to throw a massive substantial bridge, with two segmental cast iron arches, each of 350 feet span, over the straits, having a clear height above the water of 116 feet in the centre, and of 50 feet at the springing of each of those arches, which were to be supported by an intermediate pier of masonry, 120 feet wide, on a shoal called Britannia rock, and on two abutments also of masonry. His plan of operation for putting the pieces of iron for his arches together successively, so as to balance each other, by working outwards from the upper part of the pier, and of the abutments, until his semi-arches should meet at the centre of each opening, seemed to me to be crude and ill digested at the time, and either impracticable, or nearly so. As I had often previously reflected upon the subject, I gave Mr. Stephenson my opinion that, in consequence of the impossibility of obtaining any support from below, a suspension bridge such as that previously erected by Mr. Telford over the same straits, which being every where 100 feet high, offers no impediment to the navigation, and having in its present state strength enough to bear the weight of the heaviest railway train, but not with safety, owing to the flexibility and extraordinary undulations of the roadway in a gale of wind, might be rendered efficient for all railway purposes by four vertical trusses, one on each side of the two lines of rails, which, if of sufficient depth, would produce that rigid inflexibility of roadway, without which no railway bridge can be considered safe; a principle first adopted by Mr. Tierney Clark in the construction of the suspension bridge at Hammersmith, and more recently by Mr. Rendell, with no less success, in his repairs of the suspension bridge at Montrose, after

one-third of the roadway had been carried away by a storm, on the 11th October 1838, when I was travelling in the Highlands of Scotland, which drew my attention to the subject, and induced me to offer a paper on suspension bridges to the Institution of Civil Engineers, which was published in their *Transactions* for 1840. I further suggested to Mr. Stephenson, that a suspension bridge for passing a railway over the Menai Straits might be trussed to advantage by wrought iron lattice work, such as Sir John McNeill had adopted for passing the Dublin and Drogheda railway over the Royal canal near Dublin, by a bridge of 140 feet span. Afterwards the Lords of the Admiralty employed Sir John Rennie and Mr. Rendell, civil engineers, and Captain Vidal, R.N., to examine that part of the Menai Straits where the railway bridge was proposed, and to consider what conditions they thought necessary to prevent the navigation from being injured.—On receiving their report, the admiralty required that the Chester and Holyhead railway company, in making their bridge over the Menai Straits, should not construct the central pier on Britannia Rock wider or longer than 50 feet, and that there should be two openings between it and the abutments, each of 450 feet in clear width, and everywhere to be of 105 feet in clear height above high water level.

Mr. R. Stephenson's second plan, when thus obliged to withdraw the former, was to erect a suspension bridge of the usual construction, in order to obtain a platform for his further operations as I had before suggested. But the sort of bridge which he now proposed to put together by this means was of a novel and very ingenious construction, consisting of two large tubes of boiler iron, illeptical in section, and each measuring 30 feet by 15, in clear height and width; and, as he proposed that these tubes, though resting on a central pier of masonry, were to pass entirely across the straits from one side to the other, observing the conditions prescribed by the admiralty, it is evident that they could not be much less, than 1000 feet in length when finished.

On the 5th of April, and afterwards on the 6th of May, 1845, Mr. R. Stephenson admitted, in examination before the select committee of the House of Commons, that the above was the only possible mode of throwing a bridge of such large openings over the Menai Straits, but he had so much confidence in the strength and rigidity of his proposed tubes, that, after they should be placed, he thought the suspension apparatus might be removed with safety. When I was examined by the same committee, on the last named day, I gave my opinion that the tubular bridge proposed by him would be strong and safe; and that, when properly fixed, it would not be injured by gales of wind, though I was not convinced that such tubes would be better than vertical trusses; but I differed entirely from the suggestion Mr. R. Stephenson had thrown out, as to the expediency of removing the suspension apparatus—a measure which I thought would not only be unnecessary,

but that it might endanger the security of the bridge.

From this, his second project, Mr. Stephenson has since departed, having been induced to give up illiptical and adopt rectangular tubes, in consequence of experiments tried at his request in 1846, by Mr. W. Fairbairn & Mr. E. Hodgkinson, both very experienced and skilful in the uses of iron, as applied to practical architecture and engineering, and the latter having investigated the subject mathematically, and laid down rules which have been published, and are deservedly held in high estimation; this, however, may be considered rather a modification than a change. Not so the decision afterwards adopted by Mr. Stephenson, of abandoning the suspension principle altogether; instead of which he now proposes, as I have been informed by Capt. Moorsom, R.N., chairman of the Chester and Holyhead railway company, to put together in succession each of his tubes, which, according to this new arrangement, will be four in number, on a bridge of boats which will first be formed parallel to the shore, and will then be swung into the proper transverse position by the quarter circle movement, common in the practice of military bridges, after which the tube is to be suspended by chains; and though either of the sides will expose to the wind a surface of at least 1400 square feet, considerably exceeding the area of all the sails of a 28 gun ship, and will weigh, as I am told, about 1200 tons, each of these unwieldy masses, is to be raised up nearly 100 feet, by hydrostatic pressure and thus deposited and fixed on the lofty pier and abutment of masonry. If the proposed modes of passing the Chester and Holyhead railway over the Menai Straits had not been twice referred officially to me, as before stated, I should not have made any comments upon Mr. Stephenson's proceedings—but, under the circumstances above stated, I feel it my duty to express my entire dissent from this rash, if not impracticable, plan of operation, which cannot even be attempted without the risk of some very serious disaster, except at the high water slack of a deep tide, and in a perfect calm.

He has now, to my knowledge, proposed three projects, which have just been described all widely differing from each other, for passing the Chester and Holyhead railway over the Menai Straits; and I think that his second plan, the only one which I approved, would have been sufficiently arduous in itself, without adding to the difficulty, and diminishing the safety, of the attempt by the abandonment of the suspension principle; if he persists in this, his third plan of operation the chances are, that the first tube which he attempts to raise will find its way to the bottom of the straits.

Notwithstanding the objections publicly made by Mr. Locke, at Chester, to the interference of government departments with railway bridges, every disinterested person will admit that the lords of the admiralty only did their duty in putting a salutary veto upon Mr. R. Stephenson's first project, which, if it could have been carried into effect, of which

I entertain great doubts, would have seriously injured the navigation of the Menai Straits, by rendering them impassable for many of the coasting vessels now employed there.

#### Railways and their Early Opponents.

The following paragraph, which we find in the London Mining Journal, of August 7th, is so truthful, that we give it a place—with the simple observation, that the same remarks are equally applicable at the present day.

When Jacquard, the inventor of the wonderful loom that bears his name, was arrested and carried to Paris, with his machine, Carnot, in the presence of Napoleon, roughly said to him, "Are you the man that pretends to do that impossibility—to tie a knot in a stretched string?" His compatriots of Lyons, the impossibility being surmounted, broke his machines in 1806, and raised a statue to his memory in 1840. All those who are in advance of public opinion must bear ridicule or persecution. In 1825, the Quarterly Review thus ridiculed the notion of certain engineers—Telford among the rest—that a railway engine could go 18 or 20 miles an hour: "The gross exaggerations of the powers of the locomotive steam engine, or, to speak English, the steam carriage, may delude for a time, but must end in the mortification of those concerned." We should as soon expect the people of Woolwich to suffer themselves to be fired off upon one of Congreve's ricochet rockets, as trust themselves to the mercy of such a machine, going at such a rate." In that year, the common belief was, that railways were altogether delusions and impositions. The Liverpool and Manchester railway was opposed in Parliament with every form of invective. One member, in 1825, declared his opinion, "that a railway could not enter into successful competition with a canal. Even with the best locomotive engine, the average rate would be but 3½ miles per hour, which was slower than the canal conveyance." (Hansard, 2d series, vol. iv. p. 853.) Another assertion, which Mr. Huskisson was obliged to meet doubtfully and apologetically, was, "that there were two or three canals which were sufficient for every purpose of commerce in the districts through which the railway was to pass."—Let us be just to what we have been accustomed to decry as the dark ages. Let us be tolerant to those who imprisoned Galileo, and rewarded Columbus with chains. If there be a reality in any discovery—a true thing, and not a sham—if there be strength, or utility, or beauty in any work of mind—it will live and fructify, whatever critics, or orators, or inquisitors, or even kings, may do to crush it. And so it is with railways. On the 15th September, 1830, the first passenger line—the Liverpool and Manchester railway—was opened. The conveyance of passengers appears originally to have been an inferior consideration to the conveyance of goods; and the directors modestly anticipated that one-half of the passengers travelling by coaches between the two towns, might venture on the railway. In the first year after the opening, there were conveyed 445,000 passengers; in the year ending 1st July, 1845, the passen-

gers so conveyed amounted to 897,000. On the 24th April, 1847, there has been a total expended on the railways of the United Kingdom, of £78,000,000 sterling; and in the last week the aggregate receipts upon these railways was £160,000, being a total exceeding £8,000,000 per annum, for the conveyance of passengers and goods.

#### Pennsylvania the Pioneer in Internal Improvements.

*The Coal and Iron Trade of Pennsylvania in 1847.*

We continue in this number our extracts from Mr. Child's pamphlet. He says:

Now, by way of contrast, let us take the total amount of capital invested in all the manufacturing establishments at Lowell, and see how it compares with the above expenditures. During a visit to that remarkable city, last summer, we obtained a copy of the "Statistics of Lowell Manufactures for 1846." From it we learn the following particulars. The amount of capital invested in all the factories, including buildings, machinery, houses, for the operatives, etc., is as follows:

Merrimack Manuf. Co., capital,	\$2,000,000
Hamilton " " "	1,200,000
Appleton " " "	600,000
Lowell " " "	600,000
Middlesex " " "	750,000
Suffolk " " "	600,000
Lawrence " " "	1,500,000
Tremont Mills, " "	600,000
Boott cotton mills, " "	1,200,000
Massachusetts cotton mills, " "	1,200,000
Lowell machine shop, " "	300,000

Total capital, \$10,550,000

Thus it will be seen, that the whole amount invested in all the manufactories at Lowell, is less than one-third of the sum actually expended in constructing avenues for bringing Pennsylvania coal to market.

The increase in the shipments of coal coastwise from the commencement of the trade, is instructive.

The annual shipments of coal coastwise, from this port have been as follows:

Year	Vessels carrying	Tons
1822,	4	181
1823,	11	1,123
1824,	40	3,958
1825,	190	19,378
1826,	271	27,413
1827,	397	39,327
1828,	469	45,915
1829,	489	47,100
1830,	644	63,137
1831,	563	55,640
1832,	1,592	158,442
1833,	2,010	198,168
1834,	1,575	156,154
1835,	2,361	267,139
1836,	3,225	344,812

During the subsequent nine years, our returns are incomplete.

With great labor, and the aid of several kind friends, we have been enabled to ascertain with great accuracy, the total number of vessels, and their class, which cleared from this port in 1846, and the quantity of coal despatched. This statement will serve to illustrate the great value of this branch of our business in a commercial point of view.

During the year 1846, there were cleared from Richmond, the depot of the Reading railroad company,

Ships,	1
Barks,	23
Brigs,	341
Schooners,	4,092
Sloops,	935
Steamboats,	14
Barges,	928
Boats,	1,150

Total, 7,485

The quantity of coal (Schuylkill) shipped in the above vessels amounted to 883,489 tons.

During the same period, there cleared from this city and at Bristol, laden with Lehigh coal, fourteen hundred and sixty-eight vessels exclusive of boats, carrying 181,792 tons.—As far as ascertained, these vessels comprised

Barks,	2
Brigs,	135
Schooners,	682
Sloops,	178
Barges,	186
Steamboats,	3
Class unknown,	282

Total, 1468

Total number of clearances from the port of Philadelphia in 1846, eight thousand nine hundred and fifty-three vessels, carrying one million sixty-five thousand two hundred and twenty-eight tons of coal, in addition to the quantity shipped in boats from the Lehigh mines.

The quantity of coal which passed through the Delaware and Raritan canal, to New York has been as follows:

In 1842,	171,754 tons.
1843,	198,332 "
1844,	267,496 "
1845,	372,072 "
1846,	339,924 "

The total number of arrivals at New York from foreign ports in 1845, was 2,041, and in 1846, 2,289; consisting of 571 ships, 425 barks, 901 brigs, 582 schooners, 7 steamboats and 3 galliots. We have been kindly furnished by Gen. Bogardus, the collector of that port, with the exact tonnage of these vessels; in 1845, the total tonnage from foreign ports was 577,386 tons, and in 1846, 627,579 tons, including 4 steamboats. Now let us compare this statement with the amount of coal shipped from Philadelphia in the same period, 1,065,228 tons, or 437,648 tons more than the whole tonnage arriving at New York. As many vessels will carry more than their registered tonnage, we will add 25 per cent. to the above amount, which would increase the tonnage to 784,474 tons—being nearly 300,000 tons less than the quantity of coal shipped from Philadelphia.

Does not this fact speak volumes in favor of our coal trade?

As a nursery for seamen, the Pennsylvania coal commerce, even in its infancy is entitled to consideration, in a national point of view. There is no department of our commerce, if

we except the whale fisheries, which gives employment to so many vessels, or to so great an aggregate tonnage, or which calls into service so many seamen. In any emergency which might arise in the defence of our extended and dangerous sea coast, here would be found a body of hardy, bold and active men, trained for dangerous service, and equal in the most important qualifications, to the best seamen in our national vessels. Great Britain has for many years fostered her coal trade, with a view to the rearing up of seamen, to man her "wooden walls." Admiral Collingwood, and many other of her naval heroes, were trained on board British colliers.

It is not saying too much to assert, that the coal of Great Britain has been one of the chief sources of her prosperity—a prosperity which mines like those of Peru and Mexico would perhaps never have secured. That shrewd and sagacious writer, McCulloch, observes, in his Commercial Dictionary, "It is the possession of her coal mines, which has rendered Britain, in relation to the whole world, what a city is to the rural district which surrounds it—the producer and dispenser of the rich products of art and industry." If this remark be just, how clear is it that Pennsylvania must hold such a relation to the United States, if not to our whole continent. The more our position is contemplated, in the light either of history, or of sound judgment in regard to the elements of prosperity, the more clearly must it be seen, that the coal and iron of our mountains have an importance to our nation, not easily exaggerated.

On what grounds can our government reasonably hesitate to put forth her best energies for the sustaining of the great coal and iron interest of Pennsylvania—a Pennsylvania interest indeed, geographically, but a national interest in all its great ultimate bearings, if such a thing as a national interest, can be known or conceived of.

We feel that such statements as those which we present to our readers must powerfully arrest the attention of thinking men. In thus exhibiting, in an accurate statistical manner, the resources of Pennsylvania, we cannot be exposed to the imputation of a vain glorious spirit, and the information communicated must be new in a great measure, to most of our readers, and impressive to all.

In continuing our remarks on the Pennsylvania coal trade, we cannot forbear to quote the language of some eminent British writers in reference to the connection between the possession of coal mines and the prosperity of a nation.

The president of the British Statistical Society, Mr. Porter, speaks of the coal mines of England as "the source of greater riches than ever issued from the mines of Peru." He adds—"But for our command of fuel, the inventions of Watt and Arkwright would have been of small account; our iron mines must have long since ceased to be worked, and nearly every important branch of manufactures which we now possess, must have been rendered impracticable, or at least have

been conducted upon a comparatively insignificant scale."

The well known Professor Buckland says—"The amount of work done by steam in England, has been supposed to be equivalent to that of three or four hundred millions of men, by direct labor; and we are almost astonished at the influence of coal and iron and steam, upon the fate and fortunes of the human race. It is 1800 feet below the earth's surface. It rows, it pumps, it excavates, it carries, it draws, it lifts, it hammers, it spins, it weaves, it prints. We need no further evidence to show that the presence of coal is, in an especial degree, the foundation of increasing population, riches and power, and of improvement in almost every art which administers to the necessities and comforts of mankind."

A writer in a well known English periodical, pronounces coal "the chief source of the national wealth and power, and the foundation of our manufacturing industry. Without such a supply of fuel, our iron, lead, tin and copper ores must have remained in their beds."

Of coal, and its proximity to iron ore, Professor Bakewell remarks, "The frequent occurrence of these minerals together, both destined in future to give to man an extensive empire over the elements, and to contribute largely to his means of civilization and comfort, cannot fail to impress the reflecting mind with evidence of prospective designing intelligence."

In a parliamentary document, Mr. Buddle the eminent engineer, states, in a striking manner, his view of this subject: "Should our coal mines ever be exhausted, the manufacturing interest would melt away at once. We should lose many of the advantages of our high civilization, and much of our cultivated ground must be shaded with forests, to afford fuel for the remnant of our present population."

Mr. McCulloch, author of the Commercial Dictionary, says—"Our coal mines are the principal sources and foundation of our manufacturing and commercial prosperity.—Since the invention of the steam engine, coal has become of the highest importance as a moving power; and no nation, however favorably situated in other respects, not plentifully supplied with this material, need hope to rival those that are, in most branches of manufacturing industry. The citizens of Glasgow, Manchester, etc., are able, at a small expense comparatively, to put the most powerful and complicated machinery in motion, and to produce results quite beyond the reach of those who have not the same command over coal or (as it has been happily defined) boarded wealth. Our coal mines have been sometimes called the Black Indies; and it is certain they have conferred a thousand times more real advantage on us, than we have derived from the conquest of the Mogul Empire—or than we should have reaped from the dominion of Mexico or Peru.

When we remember that Pennsylvania is the only State which possesses anthracite coal (in any amount worthy of mention,) and when

we notice the remarkable fact that she is the only State which has direct access by water at once to the ocean, the lakes and the Mississippi, we perceive that her position, as well as her internal resources, is such as to justify very high expectations in reference to her future wealth and influence. Estimates based on the United States census of 1840, and other statistical returns, place the total value of real estate in Pennsylvania at \$1,400,000,000 at the value of personal property at \$700,000,000, making an aggregate capital of \$2,100,000,000—more than three times that of New York! This result, striking as it is, becomes less astonishing, the more we contemplate the peculiar endowments of Pennsylvania.

The three anthracite coal fields of Pennsylvania, are each about 65 miles in length, and 5 miles in width; embracing an area of 325 square miles, or 280,000 acres each.—The aggregate is 975 square miles or 624,000 acres.

We estimate the supply of anthracite coal for 1847, at 2,800,000 tons. The value of this quantity at \$4 per ton, which may be taken as the average price at tide water, is \$11,200,000. The importance of this trade to the city of Philadelphia, while it is great in other respects, is shown strongly in the fact that a large portion of the coal lands are owned here, and the revenue therefore reverts to our citizens. The constantly increasing use of this fuel in other parts of the country, tends to keep the balance of trade with other cities continually in our favor; and this tendency must increase with the increasing demand for our coal. The coal trade of Great Britain has made the port of Newcastle, which would otherwise be an unimportant place, second only to London in the amount of its shipping. A similar effect must our coal trade have upon the port of Philadelphia making it the great shipping port of the Union.

It is interesting and amusing to look back to the first attempts made to use the anthracite coal, and to bring it to market. Our venerable friend, Hon. Charles Miner, of Wilkesbarre, in his published account of his first efforts, in connection with Mr. Cist, and other associates, relates some pleasant anecdotes.

A hunter had first discovered the black earth which covers the coal at Mauch Chunk, and reported the discovery to Jacob Weiss, Esq., of Lehigh, who caused an examination to be made, and found anthracite coal within ten feet of the surface. The land, which had not been appropriated, was immediately taken out of the land office, and a company was formed, which partially opened the mine, and brought some small parcels of coal to Philadelphia. The difficulty of kindling the coal, prevented its introduction into use, and the project slept for twenty years.—During the war with Great Britain, bituminous coal rose to high prices. Judge Jesse Fell had shown that anthracite coal could be burned in grates, and it had been for several years used in Wilkesbarre and the neighboring towns. The demand for fuel in Phila-

delphia now led Mr. Miner and Mr. Cist to contrive a plan for mining and transporting the Mauch Chunk coal. On the 9th of August, 1814, they started off their first ark from Mauch Chunk. "In less than eighty rods from the place of starting, the ark struck on a ledge, and broke a hole in her bow.—The lads stripped themselves nearly naked, to stop the rush of water with their clothes." In six days, however, the ark reached Philadelphia, with its 24 tons of coal, which had by this time cost fourteen dollars a ton. But, says Mr. Miner, "we had the greater difficulty to overcome of inducing the public to use our coal, when brought to their doors. We published handbills, in English and German, stating the mode of burning the coal, either in grates, in smith's fires, or in stoves. Together we went to several houses in the city, and prevailed on the masters to allow us to kindle fires of anthracite in their grates, erected to burn Liverpool coal. We attended at blacksmith's shops, and persuaded some to alter the Too-iron, so that they might burn the Lehigh coal; and we were sometimes obliged to bribe the journeymen to try the experiment fairly, so averse were they to learning the use of a new sort of fuel."

How like a fable all this seems at the present day! As we sit before our coal fires, and think of no other, how little do we realize that thirty years ago Mr. Miner and Mr. Cist were trying the experiment of an anthracite fire at Wilkesbarre, and wondering whether they could not float an ark load of the coal to Philadelphia! Now we are reckoning the coal trade in millions of tons!

In the Schuylkill region the effort was made a little earlier. In 1812, Col. George Shoemaker loaded nine wagons with coal at the place now known as the Centreville mines, and proceeded to Philadelphia.—"Much time was spent by him in endeavoring to introduce it to notice, but all his efforts proved unavailing. Those who deigned to try it, declared Col. Shoemaker to be an impostor for attempting to impose stone on them for coal, and were clamorous against him. Not discouraged by the sneers cast upon him, he persisted in the undertaking, and at last succeeded in disposing of two loads, for the cost of transportation, and the remaining seven he gave to persons who promised to try to use it, and lost all the coal and charges."

These early persevering efforts cannot but be regarded now with grateful interest. To the enterprize of those men we are indebted for the knowledge of the great resources which now baffle computation. Let any one look around at our coal wharves and coal yards, and then look back a little more than thirty years, and in imagination see Mr. Shoemaker and Mr. Miner going about our city to find some one who would consent to try the despised stone coal in his shop or his fire place, and denounced as enthusiasts, or even impostors!

The consideration of the coal of Pennsylvania leads us naturally to speak of her beds of iron ore, and of the manufacture and uses of this metal. Before proceeding to this subject, it is proper to remark that in exhibiting

the present state of the coal trade, we might have taken into view the fact that the *Schuylkill Navigation*, which has been undergoing enlargement, has necessarily been out of use for the past year, and that its capacity for transportation is now greatly increased.

NOTE.—Perhaps we should have before stated that all the companies in the Lehigh region own their own mines; but the value of them has in no case been included in our statement of the cost of the different railroads and canals. The Lehigh Coal and Navigation company, for instance, own 15,928 acres of land, upwards of 6,000 acres of which contain coal; out of 30 acres of land, 1,100,000 tons have already been mined and sent to market. The Little Schuylkill company's lands and improvements cost upwards of six hundred thousand dollars, in addition to the cost of their road. The aggregate value of the lands and improvements is of course very large. In the Schuylkill region a single company has expended \$50,000 for steam engines and other fixtures.

To be continued.

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.** Proposals will be received at this office, and at the office of the Resident Engineer, in Gardiner, until the 21st of August, for the Grading and Masonry of 21 miles of this road, extending from Bowdoinham to Augusta.

The line of road and the plans and profiles will be ready for examination on the 12th of August, after which time any information in relation to the work can be had at the engineer's office in Brunswick and Gardiner, or of the resident engineer on the line of the road.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to complete the work.

The remainder of the line from North Yarmouth to the depot of the Portland, Saco and Portsmouth Railroad in Portland, 15 miles, will be ready for contract on the 18th of September, of which due notice will be given. **GEORGE S. GREENE,**  
Engineer K. & P. R. R.

ENGINEER'S OFFICE, K. & P. R. R.)  
Brunswick, July, 12, 1847.

233

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

**C. B. STUART,** Engineer.  
Hamilton, July 30, 1847.

COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

FOR  
PASSENGERS, SPECIE, GOODS, PARCELS, etc.  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise,] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

ROBERT GRACIE.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse E. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**LAP-WELDED WROUGHT IRON TUBES**  
for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

1y

**A. & G. RALSTON & CO., NO. 4**

South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons 2 1/2 x 1/4 inch Flat Punched Rails, 20 ft. long.

25 " 2 1/2 x 1/4 " Flange Iron Rails.  
75 " 1 x 1/4 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

26f

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merrihew, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston.

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
Patterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10f

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2 1/2 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4¢ =		101 25
Workmanship free of patent charge.		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**  
Civil Engineer and Patentee.  
No. 277 South Third St., Philadelphia. 33f

## LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address

**ANDREW MENEELY.**

West Troy, May 12, 1847.

1y\*21

## PIG AND BLOOM IRON.—THE SUBSCRI-

bers are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**

Vine St. Wharf, Philadelphia.

12f

## RAILROAD IRON.—THE "MONTGOMERY"

Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

Agents.

1y48

77 Pine St., New York.

## LAWRENCE'S ROSENDALE HYDRA-

lic Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by **JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection, in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills), and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.] WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halvards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.			STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.		
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.		Tons.
11	4 1/4	13 5	10	24 -		50	15-16		20
13	3 1/2	9 3	8 1/2	16 -		27	11-16		13 1/2
14	3 1/4	6 11	7 1/2	12 8		17	9-16		10 1/2
15	2 3/4	5 2	6 1/2	9 4		13 1/2	1-2		7 1/2
16	2 1/4	4 3	6	8 8		10 1/2	7-16		7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

## RAILROAD SCALES.—THE ATTENTION

of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

Philadelphia, Pa.

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846.

[1y4]

Philadelphia, Pa.

## RAILWAY IRON.—THE BEST QUALITY

of English Heavy H Rails—60 lbs. to the yard—now in store, landing from the vessel, and on ship board to arrive, for sale on most favorable terms by

DAVIS, BROOKS & CO.,

Jan. 2.

[1tf]

68 Broad St., New York.

## NICOLL'S PATENT SAFETY SWITCH

for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY.

The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 12th and Market sts., Philad., Pa.

## RAILROAD IRON.—THE NEW JERSEY

Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10tf

## RAILWAY IRON.—DAVIS, BROOKS

& Co., No. 68 Broad Street, have now in port on Ship-board, 200 Tons of the best English heavy H Rails, 60 lbs. to the lineal yard, which they offer for sale on favorable terms, also, about 6 to 700 Tons now on the way, to arrive shortly, of the same description of Rail.

40tf

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

MANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	x 20 inches Stroke.
"	2,	14	" " " x 24 " "
"	3,	14½	" " " x 20 " "
"	4,	12½	" " " x 20 " "
"	5,	11½	" " " x 20 " "
"	6,	10½	" " " x 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK.** F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, 4 mos. from delivery of brick on board. Refer to

 New Jersey Malleable Iron Co., Newark N. J.  
 Gardiner, Harrison & Co. Newark, N. J.  
 25,000 to 30,000 made weekly.

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works situated in the town of Newcastle, Del. Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
 a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by  
 A. & G. RALSTON  
 Mar. 20th 4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL** Dam For Sale. A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 8,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 ft., with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, trums, pulleys, &c., large and small trip hammers, furnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45x20 feet, containing a large air furnace, cupola, crane and iron oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 51x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia.

**TWO LOCOMOTIVE AND MARINE ENGINE** Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,  
 Warehouse S. E. corner 3d and Walnut Sts., Philadelphia

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

2nd

J. BALL &amp; CO.

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland.

WALDO HIGGINSON, Agent.

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

" " Pottsville, 34		1 40	and 1 20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

# PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3 1/2 p.m. No line on Sun.

Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12 1/2 p.m., 4 p.m., 7 p.m., 10 p.m. mail.

Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4 1/2 p.m., 7 p.m., 12 1/2 a.m., night mail.

J. R. TRIMBLE,

2d Engineer and General Superintendent.

# GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO DALTON, 100 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 408 miles in length, from Charleston to Dalton (Cross Plains) in Murray county, Ga.—33 miles from Chattanooga, Tenn.

## RATES OF FREIGHT.

	Between Augusta and Dalton, 171 miles.	Between Charleston and Dalton, 408 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.	\$0 18	\$0 28
2d class. Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.	0 40	0 65
Cotton, per 100 lbs.	0 45	0 7
Molasses, per hogshead.	8 50	13 50
" " barrel.	2 50	4 25
Salt per bushel.	0 18	
Salt per Liverpool sack.	0 65	
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.	0 75	1 50

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight payable at Dalton.

F. C. ARMS,

Supt. of Transportation.

Augusta, Ga., July 15, 1847, 441y

## RATES OF FREIGHT

On CHANDLER'S Through Transportation Line, between Charleston, S. C., or Savannah, Ga., and Decatur, Ala., and Knoxville, Tenn., and all intermediate points on the Tennessee River, viz:

Between Mazon	and Decatur and intermediate points.	0 22 1/2	1 54	1 10	1 05	0 81	0 86
Between Augusta	and Knoxville & intermediate points.	0 22 1/2	1 54	1 10	1 05	0 76	0 81
Between Savannah	and Chattanooga.					0 61	0 66
Between Mazon	and Decatur and intermediate points.	0 24	1 70	1 15	1 15	0 85	0 90
Between Augusta	and Knoxville & intermediate points.	0 24	1 70	1 30	1 30	0 80	0 85
Between Savannah	and Chattanooga.					0 65	0 70
Between Mazon	and Decatur and intermediate points.	0 32	2 20	1 35	1 35	1 05	1 10
Between Augusta	and Knoxville & intermediate points.	0 32	2 20	1 40	1 40	1 00	1 05
Between Savannah	and Chattanooga.					0 85	0 90

1st class.—Boxes of Hats, Bonnets and Furniture per foot.  
2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cans) Drugs, Confectionaries, Shovels, Spades, Scythes, Smith's Bellows, Baskets, Tubs, Sitters, Brooms and other light articles, per 100 lbs.  
3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheese, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casks, or Crates of Crockery, Hardware, and other heavy articles not enumerated below.  
4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Lumber, per 100 lbs.  
Cotton, per 100 lbs.

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.: and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.

Chattanooga, Tenn., July 1, 1847.

## REGULAR RATES BETWEEN ATLANTA AND CHARLESTON OR SAVANNAH.

First class, per foot.	\$0 20
Second class, per 100 lbs.	1 20
Cotton, per 100 lbs.	0 55
Third class, per 100 lbs.	0 60
Fourth class, per 100 lbs.	0 50

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, September 11, 1847.

TO CONTRACTORS we would say, look at the following Advertisement.

**NOTICE TO CONTRACTORS.—ANDROS, COGGIN AND KENNEBEC RAILROAD.**  
Proposals will be received at the Treasurer's Office in Waterville, until the 25th of September next, inclusive, for the Grading and Masonry of the 3d Division of this road, extending from East Readfield to Waterville, about 20 miles.

Also, for such sections of the 2d Division as shall not be previously disposed of.

Profiles will be ready for examination on the 20th of September, and any information respecting the line can be obtained on application to the resident Engineers.

On the 24th of September the Engineer will be at Winthrop, and will be prepared to accompany contractors over the line of the road.

HOBART CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office Lewiston,  
August 25th, 1847.

**RAILROAD IRON.—400 TONS ENGLISH,**  
60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
68 Broad Street, New York.

1m37

**FOR SALE.—300 TONS (10 MILES) FLAT**  
Bar Rail, in parcels or wholesale—section 34 inches wide by 1 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
Wilmington, Del.

1m37

**RAILROAD IRON.—500 TONS OF BEST**  
quality Bridge Rails, 53 pounds to the yard, to arrive, and for sale by A. & G. RALSTON,  
No. 4 South Front Street, Philadelphia.

Also, a 2-hand Locomotive Engine, of Baldwin's make, for sale low.  
September 8, 1847.

3137

### Suspension Aqueducts.

We learn that the Delaware and Hudson canal company are putting *suspension aqueducts* over the Delaware and Lackawanna rivers, for the passage of their canal. These aqueducts are to be on the plan of that for the Pennsylvania canal over the Allegheny at Pittsburg; and to be of sufficient capacity for boats to pass each other, with a depth of six feet of water. The piers and abutments are to be put up by the company, in the most substantial manner, and the trunk, with the suspension apparatus, will be put up by Mr. JOHN A. ROEBLING, who constructed the suspension aqueduct over the Allegheny, and the suspension bridge over the Monongahela, rivers, at Pittsburg.

To sustain the great body of water, suspension cables will be used, of 8½ inches diameter, manufactured by Mr. Roebling in the same manner as those used at Pittsburg; and these works, when completed, will do credit to the company, which has been singularly fortunate in the selection of able and faithful men for the construction and management of its important works; and thus it is that its stock is one of the very best in the market—or, rather, in the hands of capitalists—as it is too valuable to be often offered for sale.

### Great Western (Canada West) Railway Report.

We have before us the Report of CHARLES B. STUART, Esq., Chief Engineer of this very important work.

Mr. Stuart only commenced the surveys for location of this road early last Spring; yet, by the extraordinary efforts of himself and his able assistants, he has, according to his report, explored and surveyed nearly fifteen hundred miles of different lines—located 277½ miles—put 42 miles under contract, and advertised one hundred and fifty-nine miles more to be let on the 1st of October next. If Mr. Stuart has performed this service as well, as he has done it rapidly—and we doubt not he has—the company have indeed been fortunate in their selection of an engineer. It was supposed by some that the company would employ an engineer from England, as most of the stock is owned there: but we are of the opinion—and so seems the company to have been—that for a comparatively new country, and sparse population, with limited capital, an American engineer will be found the most profitable—or, rather, the least expensive; that is, they can accomplish a given amount of work, in a shorter period, and at

less expense, than those of almost any other country.

We shall re-publish the report nearly entire, with a map showing the connection of the Great Western railway with New York, Boston, Portland and Montreal, on the east, and the railroads through Michigan to Chicago and St. Louis, on the west—and possibly with the other map, showing "Canada West" with its subdivisions, if we can get it printed in time.

This road, it will be recollected, is to be connected with the Niagara Falls and Lockport railroad, by a Suspension Bridge, over the Niagara river at the Falls—thus giving the route an attractive feature, which no other road in the world can possibly have.

### Coal Trade of Pennsylvania.

From the following statement it appears that, up to 2d inst., the increase of coal sent to market this, over last, year is 347,463 tons. The increase this year will undoubtedly exceed 500,000 tons, showing a very rapid increase of demand. The editor of the Commercial List says "there is a steady demand for anthracite coal, and prices have advanced, owing to an advance on the 1st inst. of 10 cents per ton in the freight on the Reading railroad. Schuylkill white ash ranges from \$3 90 to \$4 05, and red ash \$4 05 to \$4 25 per ton. In Lehigh coal no changes. Three cargoes Allegheny bituminous coal sold at 20 cents per bushel.

The comparative supplies of coal sent to market have been—

	1846.	tons.	1847.	tons.
Lehigh canal, to Aug 25,	312,791	Aug. 24,	391,264	
Reading railroad,	27, 759,836		26, 848,506	
Schuylkill canal,	enlarging.		26, 128,210	
Del. and Hudson do.	15, 159,466		21, 211,576	
	1,232,093		1,579,556	
			1,232,093	

Increase in 1847,.....347,463

The probable supplies from these regions in all this year, with a favorable fall, will be—

By Reading railroad.....	1,300,000 tons.
By Schuylkill canal.....	200,000 "
By Lehigh canal.....	630,000 "
By Delaware and Hudson canal.....	410,000 "

Total.....2,540,000 "

Brought down by Reading railroad, week ending 2d instant, 34,548 tons. Total, since January 1st, 883,054 tons. Shipped by Lehigh canal week end-

ing 31st ult., 20,899 tons. Total this year, 411,164 tons. Shipped by Schuylkill canal, week ending 2d inst., 8,165 tons. Total this season, 136,375 tons.—Total shipments this year by Delaware and Hudson canal, 214,576 tons. Total supply this week, 63,612 tons. Total this year, 1,642,169 tons."

#### Copper Mine of Falun, in Sweden.

*Extracted from Rees' Cyclopaedia, article, Sweden.*

"Copper is found in various places in Sweden, but the chief mines of this metal, which are in the province of Dalecarlia, have been wrought from time immemorial. The metal is not found in veins, but in great masses, and does not extend more than an English mile in circumference. The matrix of the ore is the saxum of Linnaeus, or rock and pyrites of iron. The richest part of the ore has been supposed to yield 20 per cent. of copper; but as the poor and rich are blended, they average only 2 per cent. when brought from the mine, and 19 when smelted. The mine is private property, and is divided into shares, 1200 workmen are employed, viz: 600 miners, and the same number in roasting and smelting the ore above ground. The mouth or opening of the mine, says Mr. Cox, is extremely large, perhaps the largest in the world—being 1900 feet in diameter, or nearly three-quarters of an English mile in circumference; an immense chasm, gradually enlarged to its present size by the excavations and frequent downfalls of the rock. The perpendicular depth is 1020 feet."

The foregoing description of the celebrated copper mine in Sweden, has been sent to us by an esteemed friend, with the suggestion that its publication might—in these days of copper mining celebrity—be interesting to our readers; we therefore give it a place in the Journal—with the single remark, that we believe the time is not distant, when copper will be found in such abundance in this country, that its relative value, compared with silver and gold, will be such that pennies will be equal to quarter-pound weights—or, in other words, copper will be almost as cheap as lead and iron.—[Ed. R. R. J.]

#### The Iron Trade.

The average quotation for rails on the 13th August, was £9—in London, Welsh and Staffordshire firm, but Scotch pig is a shade lower, though stocks at Glasgow are reported as very small, and a large body of the men still remain out on the strike. In foreign iron and steel nothing new.

*Glasgow Pig Iron Trade, August 12.*—The price of pig iron has slightly declined since our last—caused, no doubt, by the tightness of the money market; were it not for this, iron would command high rates, as the stock has been greatly reduced lately, through the miners' strike, which still continues.—This week, mixed nos. changed hands to some extent, at 68s. and 67s. 6d., cash; there is very little iron offering. To-day the market is a shade firmer, we quote No. 3 at 67s., mixed nos. 68s., No. 1 69s. and 69s. 6d., cash, free on board.

#### Coal Trade.

We have been furnished with the following statement of the coal sent to market by the Schuylkill canal—which we shall publish as furnished weekly.

SCHUYLKILL NAVIGATION.—Week ending September 2d, 1847.

	Tons. cwt.
Pottsville and Port Carbon.....	6,845 09
Schuylkill Haven.....	1,319 18
Port Clinton.....	00 00

This week..... 8,165 07  
Previously..... 128,210 01

Total..... 136,375 08

#### Railroad Iron.

From the reports in the papers, which we understand to be correct, it appears that American railroad iron, to be delivered a year or two hence, has been contracted for at \$60 50 per ton, to be delivered on the line of the Central Pennsylvania railroad, by Messrs. DAVID REEVES & Co., of this city. It is said that they contemplate erecting a rolling mill for railroad iron, at, or near, Harrisburg, and thus save, to a great extent, the cost of transporting the coil, the pig and the manufactured article, as the road for which the iron is intended, is to be commenced at Harrisburg, and constructed westward, and thus becoming its own carrier of its own materials.

Harrisburg is an exceedingly favorable point for the manufacture of iron, as the coal and the pig iron can be got there as cheap as at almost any other place in the State; and the facilities for sending away the rails when manufactured, are, or soon will be, equal to those of any other central position.

In the materials for the construction of railroads, Pennsylvania is not surpassed even by England herself—and the time is not distant when those materials will be brought into use to an astonishing extent. The Central road once in operation, the people of Philadelphia will see, and feel, the importance of another line of railroad to Lake Erie, the great outlet of the west.

#### Railway Time Tables.

An engineer of Paris, named Ybry, says the Mining Journal, has taken out a patent for the construction of a time table in such manner, that by its means, the time necessary for the successive trains to perform the different parts of the journey, can be so regulated as to avoid each other; and the time of extraordinary or express trains, can be quickly laid down, so as not to interfere with the progress of the other trains. It will show at a glance the working of the different trains, giving immediately, without calculation, the time at which each train arrives at and departs from the various stations; the time at which it should be at any part of the journey, and the time that each train stops at each station. A parallelogram is drawn on a sheet of paper, with perpendicular lines, which represent the length of the line, and vertical lines representing time. Knowing the time a train starts, and the time it should arrive at its journey's end, and going an uniform pace, it is only to lay a T square from one hour in the top line to the arrival hour in the other, and the intermediate times and stations will be all seen at a glance.

#### Electricity in Leather Bands.

The London Mining Journal says that "In Dr. Silliman's American Journal there is a notice on the above subject, showing a property in leather which we think it is not generally known to possess. In examining the leather bands of a cotton mill, on the sea coast of the State of Maine, they were found to be highly excited. There are several hundred bands in the mill, and those which turn upon wooden drums or pulleys, whereby they are partially insulated, become highly charged. One fixed upon for making most of the experiments was 35 feet long, 9 inches wide, moving 1600 feet per minute, passing round two wooden drums, which revolve upon an iron shaft 180 times per minute; and in clear weather an electric spark may be taken on the knuckle held below the band at 17 inches distance; on presenting the end of the finger, the striking distance is 3 feet; the point of a black pencil shows a distinct brush 4 feet from the band, and a steel point becomes luminous at 7 feet. When the bands are in this

condition, the first processes of the cotton manufacture are attended with serious inconvenience; the fine filaments of the cotton repel each other, causing a deal of waste, and in several instances the whole 'drawing,' as it is termed, has been lifted from the machine to a band 4 feet above it. These difficulties have now been partially removed, by extending a conductor of wire to an iron steam pipe which passes through the rooms, and by emitting jets of steam near those bands that are most highly charged. By presenting a piece of leather 2 feet long, with one edge slightly curved, to the band, a succession of brilliant flashes and jets is immediately produced, giving a very perfect imitation of the aurora light. Other beautiful experiments were entered into, showing the favorable nature of the climate for the development of electricity, which, probably, at no season could be observed in this country."

#### Pennsylvania the Pioneer in Internal Improvements.

*The Coal and Iron Trade of Pennsylvania in 1847.*

We continue, in this number, this exceedingly useful and interesting production of Mr. Childs—even at the risk of being deemed *piratical*—as it furnishes a mass of information not conveniently got elsewhere, which should be more widely disseminated.

There are some remarkable facts given in that part relating more particularly to the "Iron Trade." In a somewhat lengthy table, is shown the variations of the price of English merchant bar iron in Liverpool, during a period of *forty-one years*, from 1806 to 1846, both inclusive. The lowest price was £4 10s., in June, 1843—and the highest price was in May, 1806, £17 10s. or a fall of nearly 4 to 1. It is also shown, that in 1803 the duty on bar iron was £4 4s. 4d., which was increased from time to time to £6 10s. in 1825, if imported in British ships, or £7 18s. 6d., if in foreign ships. If like causes produce like effects, and we may learn wisdom by experience, it would be well for our legislators to read this little pamphlet; as it appears that when the duties were increased the prices invariably declined, and when they were reduced the prices advanced. It was the settled policy, however, of the government, to impose high duties on iron, until her manufactories were apparently beyond the influence of competition. It is possible, however, and we think probable, also, that the time is not distant when we shall become their competitors in this, as we have in other branches of business.

In considering the advantages which Pennsylvania is to derive from her beds of iron ore, it would be pleasant, did our limits permit, to dwell on the wonderful application of this metal to the purposes of human life.—Still more interesting would it be to notice the rapidity with which the uses of iron multiply, in all parts of the civilized world, as human ingenuity extends its range, and increases the number of its devices. This increase in the use of iron, we suspect, is far beyond the conceptions of those who have not been led to pay particular attention to the subject. Among the important new applications, we may specify the iron vessels, the trial of which has been highly satisfactory; the iron roofs, iron fronts, iron buildings, and fire proof constructions in building, which are adopted to a wonderful extent in some portions of England, and will be very rapidly brought into use in this country; and the iron bridges, railings, vehicles, engines and

utensils, which are everywhere taking the place of the wooden predecessors. Under this head we may indeed place that greatest of all applications of iron—the railroad—because railroads are a comparative novelty in our country.

In 1765, there were shipped by sea from Philadelphia, 822 tons of bar iron, price £28 per ton; and 813 tons of pig iron, price £7 10s. Compare this statement with that given by Mr. Ellet, president of the Schuylkill Navigation company, in his late able report of the 4th instant:—"That the mere increase of the production of this metal, in the valley of the Schuylkill alone, during the last 18 months, exceeds the entire production of all the furnaces of Great Britain, 90 years ago!"

In tracing the history of Pennsylvania iron works, the earliest official information which we find, is contained in "A Statement of the Arts and Manufactures of the United States, prepared in execution of an instruction of ALBERT GALLATIN, Secretary of the Treasury—given by him in obedience to a resolution of Congress of the 19th of March, 1812." This document abounds in just and striking views of the true elements of national prosperity, views worthy of the able financier who was secretary of the treasury under that enlightened and illustrious president—James Madison. This work was prepared by Tench Coxe, Esq.

From this work we learn the number of furnaces in Pennsylvania in 1810, and the amount of their yearly products, as well as their location.

#### Number of Furnaces in Pennsylvania in 1810.

Locations.	Blast.	Air.	Product. tons.	Value.
Philadelphia co.,	0	2	820	\$71,000

Maryland,	9	1	10	5,000
Virginia,	16	2	13	6,930½
Ohio,			3	1,187
Kentucky,	4	4	0	1,000
Tennessee,			6	587

**Total,** 88 44 154 53,908½ 2,981,277

The character of Philadelphia as a manufacturing city, had even then attracted attention. The document above mentioned makes the following statement, which, taken in connection with its date, is well worthy of special notice:—"The manufactures of the city of Philadelphia (within the strict charter limits of less than two square miles) containing on about 1100 acres of land, 53,722 persons, amount to \$9,347,767." So early, and before our anthracite coal was known, and when our iron trade was in its infancy, did Philadelphia assume the position (which she is destined yet to hold in most conspicuous and undeniable pre-eminence) of the great manufacturing city of the Union.

By a most remarkable arrangement of Providence, our State, in which such wonderful deposits of coal are found, is also bountifully supplied with iron ore. It is said that there are very few, if any counties, which do not possess some of the ores of this metal; but the proximity of beds of iron ore to the great coal fields, and the abundance of limestone in the same districts, are circumstances of great importance, and indicate clearly the great leading occupation of Pennsylvania. Already one-half of the iron produced in the Union, is produced in this State. The discovery, in 1840, of the method of using anthracite coal, in the reduction of iron ore, was of course the event which completed the full exhibition of our mineral wealth.

In order to show the vast expenditures of the State in furnishing facilities for bringing the iron of our mountains, as well as the coal to the seaboard, and also the trade of the west to this city, we copy the following official statement from a valuable document exhibiting the financial affairs of Pennsylvania, by W. Hammond, late chief clerk of the auditor general's office.

Railroads.	Length.	Cost.
Columbia,	82 miles.	\$4,204,969 96

**Total cost,** \$29,090,294 98

After surveying this vast expenditure by the State of Pennsylvania, for the development of her own resources, let us call attention, by way of contrast, to the astonishing fact, that the sum of all the appropriations made by the United States government, for the construction and repair of roads, fortifications and harbors, and for the improvement of rivers, from 1806 to 1845, is only \$17,199,223! And then, when we come to add the cost of the improvements constructed in our State by private enterprise, and find the whole amounting up to ninety millions or more, how nobly does Pennsylvania appear, in comparison with even the federal government itself!

Great Britain is the country to which we must look for historical information in regard to the manufacture of iron. The iron trade of Great Britain may be taken as, in some measure, a prospective representation of our own. For this reason, accurate information respecting the progress and present extent of that trade, is of great value in this country; and we are happy to be able to lay before our readers information of such a character, which we have prepared from late important parliamentary documents, and other authentic sources.

The earliest iron works in Britain were in the Forest of Dean, where, says a quaint historian, "abundance of wood is yearly spent." In the reign of Elizabeth, the effect of the iron works in producing a scarcity of timber for ship building was felt; and in 1581, an act was passed requiring that, inasmuch as "the necessary provision of wood doth daily decay and become scant," no new iron works should be erected within twenty-two miles of London, nor within fourteen miles of the river Thames; and a subsequent act ordered that "no timber of the size of one foot at the stub, should be used as fuel at any iron work." In the reigns of James I. and Charles I., attempts were made to smelt iron with pit coals, but without success; and the iron works in many parts were stopped entirely, and in others diminished their operations.

About 1620, Edward Lord Dudley discovered a process for the use of pit coal, and obtained a patent. He erected a furnace, and succeeded in making seven tons of iron per week; but the mob destroyed his works, and defeated his plans, and it was a century before his process came into general use.

A historian writing in the reign of Charles II. says—"Very many measures of ironstone

ore are placed together under the great ten yards thickness of coal, and upon another thickness of coal two yards thick, not yet mentioned, called the bottom coal, or heathern coal, as if God had decreed the time when and how smiths should be supplied, and this island also, with iron; and most especially that this coal and iron stone should give the first and last occasion for the invention of making iron with pit coal." The same writer states that in the twelfth year of James I., there were in England, Scotland, Ireland and Wales, 800 furnaces, forges or iron mills, making iron with charcoal. Of these he reckons 300 to have been blast furnaces, each making 15 tons of pig iron per week, and some 20 tons, working forty weeks in the year; the forges make from three to six tons of bar iron per week.

For want of a supply of fuel, the quantity of iron manufactured in Great Britain steadily decreased, although the demand increased. Recourse was therefore had to foreign countries. From 1710 to 1718, the quantity imported from foreign countries annually, (being chiefly from Sweden and Spain) averaged about 17,000 tons, and the duty upon it about £35,000. As late as 1769, there were imported from Russia alone, 34,000 tons.

The following table shows the number of furnaces, and the make in each county, in the year 1740:

Counties.	Furnaces.	Tons.
Brecon,	2	600
Glamorganshire,	2	400
Carmarthenshire,	1	100
Denbighshire,	2	550
Monmouthshire,	2	900
Cheshire,	3	1,700
Herefordshire,	3	1,350
Gloucestershire,	6	2,850
Hampshire,	1	200
Kent,	4	400
Sussex,	10	1,400
Yorkshire,	6	1,400
Nottinghamshire,	1	200
Derbyshire,	4	800
Warwickshire,	2	700
Worcestershire,	2	700
Salop,	6	2,100
And Staffordshire, only	2	1,000

Total, 59 17,350

It appears, then, that the 300 furnaces before mentioned had now dwindled to 59, making 17,350 tons annually, or not quite 300 tons to each furnace.

In 1760, Mr. John Smeaton put in operation, at the Carron iron works, in Scotland, blowing cylinders, an invention which, by increasing the power of the blast, increased the production of the establishment using it.

In 1775, commenced a new period in the history of the iron manufacture. Mr. Watt's improved steam engine then came into use, for pumping water from the mines, and for blowing furnaces. In 1783, Mr. Cort obtained two patents, one for the process called puddling, and the other for rolling machines. These advantages led to a rapid increase in the manufacture of iron. In 1788 there were in England, Wales and Scotland,

Charcoal furnaces, 26 making 14,500 tons.  
Coke furnaces, 59 " 53,800 "

Total, 85 68,300 "

In 1796 there were, in all, 121 furnaces, making 125,079 tons. In 1806, an accurate return was made to parliament which showed the following result:

Coke furnaces, 222 making 250,406 tons.  
Charcoal furnaces, 11 " 7,800 "

Total, 233 258,206 "

In 1823 and 1830 returns were made which show a great increase, as compared with 1806.

	1823.	Furnaces.	Tons.	1830.	Furnaces.	Tons.
Staffordshire,	84	133,590	123	212,604		
Shropshire,	38	57,923	48	73,416		
Rest of England,	43	43,728	49	52,252		
Wales, exclusive of North Wales,	72	182,325	113	277,642		
Scotland,	22	24,500	27	37,500		

Total, 259 442,066 300 653,416

Let us now bring these statistics of progress into one table:

1740 furnaces	50	make	17,350 tons.
1788 " "	85	"	68,300 "
1796 " "	121	"	125,079 "
1806 " "	233	"	258,206 "
1823 " "	259	"	442,066 "
1830 " "	260	"	653,416 "
1839 " "	378	"	1,347,790 "
1841 not stated.	"	"	1,387,551 "

It is estimated that the annual manufacture of iron in Great Britain has now reached two millions of tons. In Scotland the manufacture was found to have trebled in six years prior to 1845. At the beginning of June, 1846, there were in blast in Scotland, 95 furnaces; out of blast, 35—making a total of 130. The furnaces in blast at that time produced an average of 110 tons per week each, or at the rate of 543,400 tons a year for all.

The quantity of iron imported into Great Britain in 1839, was 24,360 tons; the most of which came from Sweden.

The British duties on foreign bar iron have been as follows:

	£	s.	d.	
1782,	2	16	2	per ton.
1797,	3	4	7	"
1802,	3	15	5	"
1805,	5	1	0	"
1806,	5	7	5 1/2	"
1809,	5	9	10	"
1813,	6	9	10	"
1819,	6	10	0	" If im-

port in British ships, and if in foreign do., 7 18 6 per ton.

In 1825 the duty on foreign bar iron was reduced to £1 10s.

It cannot be doubted that the high duties imposed for so long a period on foreign iron had a great influence in promoting the iron manufacture in Great Britain. Exertion was called forth, and ingenuity was stimulated, until this department of business acquired a strength which enabled it to stand against

\* Exclusive of North Wales, which for 1823 is estimated at 10,000 tons, and for 1830 at 25,000 tons.

the world. When this position had been attained, and the iron manufacture had risen, under the fostering care of the government, to a point at which it could defy all competition, the restrictive duties were materially reduced.

The hot blast, (one of the most important inventions in the history of the iron manufacture) was first suggested in 1829, by Mr. Neilson, of Glasgow, who took out a patent. This discovery, being found of greater value in Scotland than in England, on account of some peculiarity in the Scotch coal, greatly increased the iron manufacture of that country. A Scotch manufacturer, in writing on the subject, pronounces the hot blast "one of the greatest discoveries in metallurgy of the present age."

In 1838, Mr. Crane, an ironmaster in South Wales, made known to the British Association, that he had succeeded in applying the hot blast to the anthracite coal with complete success! This step in the progress of discovery, opened a new world in Pennsylvania. The news of it made known the great design of our vast anthracite coal deposits.

In connection with the account of the British iron trade, we give the following statement, (which those who are familiar with this subject will regard as a very important one) of the prices of merchant bar iron in Liverpool, for a period of forty-one consecutive years. We invite special attention to this table. It reveals some facts which the advocates of free trade must acknowledge to be remarkable, and for which they may find it difficult to account. It appears that as the duties advanced, prices of iron declined; and that this sequence was invariable. When the manufacture became extensive and independent, the duties were reduced, and prices materially advanced, until they are now nearly double what they were when the duties were at the highest point.

An Account of the Selling Price of English Merchant Bar Iron in Liverpool, from the year 1806 to 1846, both inclusive, as furnished by Messrs. Jevons, Sons & Co.

Year.	Month.	Price per ton.	Year.	Month.	Price per ton.

*The following Duties were imposed upon Foreign Iron imported into Great Britain in*

1803, on foreign bars, £4 4s. 4d. per ton.	
1804, " " 4 17 1 "	
1805, " " 5 1 0 "	
1806 to 1808, " 5 7 5½ "	
1809 to 1812, " 5 9 10 "	
1813 to 1818, " 6 9 10 "	
1819 to 1825, " 6 10 0 "	If
imported in British ships,	
If in foreign ships, 7 18 6 per ton.	

In 1825, Mr. Herries, Chancellor of the Exchequer, proposed a considerable reduction of the duties on forge iron. Mr. Huskisson, President of the Board of Trade, offered the

resolutions for these alterations, which were carried, and the following duties fixed on the 5th January, 1825:

	Old duty.	Present duty.
Iron, in bars or unwrought		
per ton, the produce of any British possession,		
& imported from thence, £1 2 2 £0 2 6		
In bars or unwrought, the produce of any other country, per ton,	6 10 0	1 10 0

Before entering upon the Pennsylvania iron trade, we will give place to some miscellaneous information of an interesting, and perhaps curious description, respecting the iron trade of Russia, Sweden, Spain, etc.—which must be new to most of our readers. The works of Scrivenor, and other writers, from which we derive these notices, have been accessible to very few, even among our ironmasters; and we think that the information thus furnished will be highly acceptable in a community so deeply interested in every thing connected with iron and its manufacture.

In Russia, iron ores have been known from time immemorial, but we have no information respecting mining operations in early periods. In 1569, the English obtained, by treaty, the privilege of seeking for and smelting iron ore, on condition that they should teach the Russians the art of working this metal, and pay, on the exportation of every pound, one half penny. Peter the Great himself wrought in the iron works, before he set out, in 1698, on his first journey into foreign countries. Remaining some time in Saxony, he not only made himself acquainted with the arts of mining, but requested the king of Poland to give him some workmen, and in the following year twelve were obtained. In 1719, Lieut. Col. Henning, by order of the emperor, travelled through several countries of Europe, to collect information respecting mines and foundries, and on his return, wire manufactories, forges for steel, etc., were set up.

All iron works erected with the assistance of the crown pay a tax of about six cents on each pood of raw iron, and those without that assistance about four cents. The pood is 36 English pounds. For every forge the owner pays the crown 200 rubles yearly, or about \$184.

The number of people employed in some of the iron works in Russia is astonishing. At the crown mines of Barnaul 48,000 boors are employed. The iron works of the Stroganof family have about them and on the district belonging to the family, 83,000 vassals of the male sex! Many of the private works give rise to villages, which are in size and population like our cities. The Barnaul mines afford some ore which yields from 50 to 60 per cent. of iron. But 25 per cent. is more common. The exports of iron from all the ports of Russia except those of the Caspian, in 1793, were,

	Poods.	Value in rubles.
Bar iron,	2,503,757	4,258,228
Sorted,	491,575	901,464
Cast ironware,	37,917	44,433

The ruble is 3s. 1d. sterling, and is divided into 100 copees.

In 1828 there were in the Russian dominions, 19 foundries, forges and mines belonging to the crown, and 148 establishments belonging to private families. The exports of bar iron from St. Petersburg to America were as follows in the years specified:

1783, poods 6,615	1794, poods 256,635
1785, " 38,618	1797, " 112,260
1792, " 132,380	1804, " 278,264

The exportation of iron from Russia has been upon the decline since 1784.

In 1832 there were exported to the United States, 803,508 poods of bar iron, and in

	Bar.	Sheet.
1833, 504,750 poods.	64,234 poods.	
1834, 345,080 "	13,186 "	
1837, 262,000 "	40,000 "	
1838, 270,000 "	36,593 "	

Sweden has long been celebrated for its iron. In 1740 there were 496 foundries for making bar iron and other iron manufacturer, which produced 40,600 tons. In that year the government established an office to promote the production of iron, by lending money on the ore, even at so low a rate as 4 per ct.

In 1833 there were in Sweden from 330 to 340 smelting furnaces, producing about 90,000 tons of pig iron. The smelting furnaces are licensed for a particular quantity. These licenses are granted by the College of Mines, which has a control over all the iron works and mining operations. The ironmasters make annual returns of their manufacture, which must not exceed their privilege; on pain of the overplus being confiscated.

The iron mine of Dannemora is the most celebrated in Sweden. It has been wrought for four centuries, and still yields abundance of the best iron in Europe. It was first wrought as a silver mine. The annual yield of this mine is about 4000 tons, the whole of which is sent to the house of Messrs. Sykes, in Hull, England, where it is known by the name of the Oreground iron, taking its name from the port at which it is shipped. The first or best mark is L, which sells at £40 per ton; while the best Russian mark, the C. C. N. D., is seldom higher than £20 per ton.

The cause of the superiority of the Dannemora iron has never been explained. Some chemists ascribe it to the presence of manganese. Berzelius attributed it to the presence of the metal of Silicia, while others suppose it to arise from the nature of the process employed.

The exports of iron from Sweden to the U. States from 1830 to 1838 were as follows:

	Bars.	Other iron.
1830,	15,532	422
1831,	23,133	683
1832,	20,002	1,222
1833,	20,644	343
1834,	19,618	287
1835,	28,728	476
1836,	27,342	560
1837,	10,709	151
1838,	25,660	585

The total exports in 1838 were 81,754 tons. Spain has iron of excellent quality. It is probably more ductile than any other. But

Spain has never manufactured to any great extent.

An ancient writer (Diodorus Siculus) says—"The Celterberians make weapons and darts in an admirable manner; for they bury plates of iron so long under ground, until the rust hath consumed the weaker part, and so the rest becomes more strong and firm. Of this they make swords and other warlike weapons, and with these arms thus tempered, they so cut through everything in their way, that neither shield, helmet or bone can withstand them."

The quantity of iron sent from Spain to Great Britain from 1711 to 1718, averaged 1560 tons annually. From 1729 to 1735 the average was 1770 tons. After about 1750, the exportation declined, and in 1795 ceased entirely. No iron comes to the United States from Spain.

**Improvement in Steel.**—An eminent London cutlet, Mr. Weiss, has remarked that steel seemed to be much improved when it had become rusty in the earth, and provided the rust was not factitiously produced by the application of acids. He accordingly buried some razor blades for nearly three years, and the result fully corresponded to his expectation. Analogy led to the conclusion that the same might hold good with respect to iron, under similar circumstances. So with perfect confidence in the justness of his views, he purchased, as soon as opportunity offered, all the iron, amounting to 15 tons, with which the piles of the London bridge had been shod. A part of this iron had become extremely and beautifully sonorous, and possessed a degree of toughness quite unapproached by common iron, and was indeed a perfect carburet. It produced steel of a quality infinitely superior to any with which, in the course of his business, Mr. Weiss had met; inasmuch that, while it was in general request among the workmen for tools, they demanded higher wages for working it. About eight tons of the iron was found to be of this quality.—The remainder was inferior, in consequence, as was supposed, of its having been less favorably subjected to the action of the agent producing the change.

To be Continued.

#### **Schuylkill Navigation Company.**

Continued from page 565.

#### **Canal Navigation, and the Improvements of which it is Susceptible.**

A great issue is now to be tried, for the determination of the relative merits of canals and railroads, in the transportation of an almost unlimited amount of heavy freight.

This question has been satisfactorily solved on other lines, in this and in other countries; but the results of experience have been frequently concealed by interest, and there are still those who claim a superiority for the railway in the economical transportation of every description of freight. And popular opinion, at the same time, regarding the railway as an improving machine, destined always to exhibit still happier results, and assuming that canals are, and are forever to remain stationary, has almost anticipated by its decision the result of future contests.

It is not the intention of this Board to underrate the value of the railway system, or to depreciate the visible benefits which it is conferring upon the human race. They are happy to participate in its multiplied advantages, and to witness its influence on the destiny of the world; and they rejoice at the extension of an improvement which is rapidly spreading the bounds of commerce and the area of civilization.

But they must contest the assumption that canals have already reached the limit of possible improvement, and are henceforth to remain stationary.

It is true that the efforts of genius, and the application of unlimited capital, have produced astonishing results on the great lines of modern railways, both in Europe and America; while proprietors of the early canals, discouraged by previous losses, have hesitated to venture more in enterprises of doubtful success, or contented with their ample dividends, have rested satisfied with the imperfect works that yielded them.

The line of railroad from Liverpool to London, 212 miles in length, has cost more than \$230,000 per mile, or altogether about \$50,000,000.

Was it not to be reasonably supposed that such an expenditure of capital, under the guidance of skilful engineers, made in a rich and populous country, and in a highly cultivated age, would produce remarkable results, and seriously impair the profits of a line of adjacent canals of different dimensions, having locks of different lengths and breadths, and all controlled by separate and distinct interests?

These, and most other European canals, were built at an early day, in the infancy of the art, and in the early age of the history of such corporations, before success had shown as in recent times, the power of concentrated capital, controlled by chartered institutions. They are, accordingly, in the lowest degree, imperfect; but yet, imperfect as they are, and impaired as their revenues have been by the loss of their monopoly, they still convey merchandise cheaper, and yield more liberal profits, than the most successful of the railways that now cope with them, or, indeed, the most productive railways in the world.

But let us now suppose that these primitive canals were entirely erased, and their whole trade transferred to the incomparable railways that divide it with them; that in this state of things, a capital of \$50,000,000 were commanded for the construction of such a water communication as might now be made from Liverpool, through Birmingham, to London—a canal 7 or 8 feet deep, and 120 feet wide—walled in from end to end, and completely protected from the waves of steamers—with locks 25 or 26 feet in width, and 300 or 400 feet in length, so arranged with gates as to pass through either a single boat or a steam tug and a train of boats.

Such a canal would accommodate nearly all the light coasting trade of Great Britain; it would pass vessels trading not only between the cities on the route, but it would accommodate the commerce of Ireland; take the

coal and iron from the interior to the sea board, and to the continent, without breaking bulk; admit of towing by steam tugs, with trains of a thousand tons, and be open to the use of steam passenger boats, capable of making a speed of 15 miles per hour.

Such a canal as this would correspond with modern ambition and enterprise, and be somewhat proportioned to the demands of modern commerce.

The ancient canals of England were adapted to the condition of England in a former century, and squared with the views and thoughts of an antecedent age.

Now, it may be fairly put to the common sense of every one to say, whether such a work as is here set forth, established in the present age of art, with all the resources of modern skill, would not show, when compared with the narrow, shallow, irregular and crooked ditches, accommodating boats of twenty tons, drawn by horses, which now successfully compete for heavy freight, with the noblest specimens of railway in the world; that canals also are susceptible of improvement, and may be improved to any extent that the capital supplied may contemplate.

Although the Schuylkill navigation, in its present condition, falls short of the work which we have here shadowed out, it is, nevertheless, a work which has been so constructed that it may be brought, from year to year, by a system of judicious repairs and improvements, gradually to approach this state of perfection.

It is, withal, a canal destined for more important traffic, than the midland and light coasting trade of England, and one on which steam may be immediately applied with much success, and on which it will ultimately be applied, almost to the exclusion of all other power.

The views of the Board in the execution of this work have not extended so far, but have been confined, for the time, to the wants of the trade as it is, as well as by considerations of present expediency and economy.

Still, in the reconstruction of this improvement, the application of steam as a moving power, has been kept constantly in view; and it ought, in their opinion, to continue to be the aim of the Board, and, of those on whom the management of the interests of the corporation is hereafter to devolve, to perfect those arrangements. Every dollar expended in future constructions or repairs, should be laid out with an eye to this ultimate object.

The application of steam with good effect, requires, first of all, a wide and deep channel. The mass of water driven forward by the boat, should have ample room to spread, and return into the wake, with the least possible reflux motion.

The velocity of this reflux current, depends on the speed of the boat, and the relation between its cross section and that of the channel. If the boat nearly fill the channel, the water is necessarily forced back, under the pressure of a high head, and with a speed due to that head. The speed of this reflux wave is a current to be stemmed; and the speed of this current is abstracted from the

velocity of the boat due to the action of the engine.

The only means of obtaining relief from this impediment to the application of steam, is to enlarge the channel; and this has been effectually accomplished over the greater part of the line of the Schuylkill navigation.

The whole length of the canal part of this improvement, is about 50 miles, which is composed as follows:—

The distance of which the width is less than 50 feet is.....	2½ miles.
The distance exceeding 50 feet, and less than 60 feet is.....	13½ "
The distance exceeding 60 feet, and less than 70 feet is.....	21 "
The distance exceeding 70 feet, and less than 80 feet is.....	41 "
The distance exceeding 80 feet, and less than 100 feet is.....	10½ "
The distance exceeding 100 feet, and less than 300 feet is.....	6½ "
The distance consisting of open river is.....	50 "

Distance from Fairmount to Port Carbon... 108½ miles.

Numerous experiments have been tried with a view to the introduction of steam, on many canals in this and other countries; but these have almost uniformly failed, and failed from the same cause—the want of sufficient breadth and depth of channel, in the first place, and the adoption of locks of too contracted dimensions, where the size of the channel itself may have been sufficient.

Almost any one of these unsuccessful boats, if it have the principles of motion within it, placed on the Schuylkill navigation in its present state, will yield satisfactory results, and surprise its disappointed projector.

Nevertheless, it is to be borne in mind, that although the first great step, of opening a capacious canal, and a set of excellent locks, has been accomplished, there is still a wide career of improvement before this company.

The navigation, in its present state, is adapted to the economical conveyance of the present trade—the actual cost of transporting which it should reduce more than one-half; but the trade is now increasing beyond all past example, and will very speedily exceed the capacity of all the present means of conveyance. If the peace of the country be not seriously disturbed, it appears more than probable, that all the lines now leading from the anthracite district to tide water, will soon be found inadequate, in their present condition, to vent the produce of the mines, or supply the increasing demand for coal required by the enterprise of the age, and the activity of commerce.

If we take the production of 1829—the first year in which the trade exceeded 100,000 tons—and add to that quantity 20 per cent, and so continue on from year to year, compounding at the rate of 20 per cent., although the results produced will not correctly represent the trade of each year, they will exhibit correctly the production of 1840, 1842, and 1845, and show that the average increase for the last 17 years has been, and that the present increase continues to be, at the rate of 20 per cent. each year, upon the aggregate production of the previous year.

The same rule applied to the future, will show for the increase of—

1846,	-	-	405,000
1847,	-	-	485,000
1848,	-	-	580,000
1849,	-	-	700,000
1850,	-	-	840,000

and for the aggregate trade of 1850, nearly 5 000,000 tons.

It is not maintained that this law is hereafter to prevail—for it is not permitted to men to see far into the future—but it is impossible to contemplate the causes now at work, and which are henceforth to contribute to the increase of this trade, and contend for a lower rate than that which correctly represents the past.

The coal and iron trade of Great Britain are essentially the growth of the last sixty years. They have sprung into existence since the introduction of canals, railways, and steam engines; and during a part of that period, the average increase of the coal trade, appears to have been not less than a million of tons per annum. But the advancement of Great Britain in wealth and prosperity, although it has far exceeded that of other trans-atlantic states, has never approached the marvellous strides of this young and prosperous country.

The fact is, that for three successive periods of five years, the anthracite trade of this state has increased at the rate of more than two and-a-quarter fold for each period; and if it continue so to increase during the succeeding five years, reckoned from the close of 1845, the aggregate production in 1850 will not fall much below five millions of tons. (See note 2.)

If this estimate of the future trade, based as it is, upon the past and present, be well founded, there will be an accession to the aggregate production of anthracite in the five years intervening between the close of 1845 and that of 1850, of some three millions of tons; and without meaning to underrate the claims of neighboring districts, it is the opinion of the Board that the country must look to the unrivalled facilities of the Schuylkill, and their boundless capacity for development, to furnish a very large proportion of this quantity.

We have, then—foreseeing our advantages, and the demands which are to be made on them—to prepare diligently for the accommodation of this business; and we must be on the alert, if we hope to keep up with the expansion of the wealth, industry, and consumption of the country.

The navigation, in the condition in which it will be placed on the opening of the spring trade, will be adequate, when fully supplied with boats, to the convenient transit of a million and a half of tons.

Much more can be passed, but this is probably as large a quantity as it would be judicious to force through a set of single locks.

But when a single lock is no longer sufficient, another may be placed along side of it, as has already been done on this canal in its former state.

A double set of large locks, whenever the trade is sufficient to justify their construction, will greatly facilitate and reduce the cost of

conveyance by steam. The steam tug may then enter one chamber, and its tow the adjacent lock, and both may be passed through together. Here will occur a vast saving of time and expense, when 350 tons may be passed onward more expeditiously, and for almost the same cost per mile as 60 tons in 1845.

The line may even now be worked in this way with much facility and economy. One set of the old locks having been generally preserved, steam tugs adapted to their size, but with sufficient power to convey tows of the largest class, may be used in the New York trade with entire success. The tug, with 60 tons aboard, can be passed through the small locks, while the tow, with 180 tons, is descending by the larger chamber.

But even a double set of large locks, though capable of passing some three millions of tons per annum, will scarcely be sufficient, from present appearances, and past results, to vent the trade which must be borne upon this work six or eight years hence, and a further expedient must then be resorted to.

Each of the double locks will, ultimately, have to be doubled lengthwise, so that a steam tug and its tender may enter together into the same chamber, lengthened out, and be locked through together as a single boat.

This is probably the highest degree of perfection of which canal navigation is susceptible; an arrangement which presents a channel of ample width and depth, provided with a set of well proportioned double locks, each doubled or trebled lengthwise, capable of navigation by steam tugs, with one or more boats in tow, and of passing the whole train through the locks with no greater delay than the ordinary detention of passing a single boat.

There is scarcely a limit to the capacity of a canal, well supplied with water, for the transmission of freight in this manner, or to the economy of transportation which such a work will authorize.

Five millions of tons may be passed along an improvement of this character, with no greater embarrassment from lockage than was experienced in 1841 in passing 700,000 tons.

The apprehensions entertained by some, that the supply of water will be inadequate, are not well grounded. The only deficiency in the ordinary flow of the rivers is of limited duration, confined usually to two, or at furthest three months, in the summer and autumn. To meet this contingency, the company have secured reservoir sites which, when improved, will enable them to furnish water, in addition to the ordinary flow of the river, capable of passing from seven hundred thousand to a million of tons, during the season of prevailing drought; and therefore capable of maintaining as great a trade as this company need ever wish to accommodate. These reservoir sites are all admirably located for the purpose, and were selected after careful and extensive surveys, continued through several months, by a competent engineer.

There are many other sites which may be improved, when the necessity for further accommodation approaches. The purchases so

far authorized by the Board have been confined to the few most eligible positions for the purpose.

With an ample supply of water, there is nothing to prevent the consummation of the plan here presented for the ultimate perfection of this work.

It is the enviable fortune of the stockholders of the Schuylkill navigation company to occupy the only position in this country where such an improvement will be soon needed, and to have the ground work of such an improvement already laid, so that, whenever the warning of an overwhelming trade shall call for its development, they may use the surplus means which that trade will furnish, to complete the design.

In the meantime, let it be clearly understood, it is regarded as the true policy of the company, to engage only so far in these ulterior improvements, as may be required in making necessary repairs, or by the pressure of the trade itself, which will always provide for its own accommodation. A resort to the company's credit for the purpose of improvement, beyond what is necessary for the completion of the works in actual progress, is not contemplated, and it is believed will never again be needed.

#### *Of the Facilities now Required by the Trade.*

A great revolution has been effected in the coal trade during the last few years, and a still greater is now impending.

During the past year, a work has been constructed which will enable the number of men and horses needed in 1845 to transport 60 tons to market, to take 180 tons, at about the same expense of time, and for but little more than the same expense in money. This is a great stride, which in a single season reduces the cost of freight more than one-half.

But there are inconveniences and embarrassments to which the trade has been long exposed, and the removal of which calls for all the influence this company is capable of exerting.

These embarrassments consists in the unnecessary and vexatious delays to which the boatmen are subject, from the time they reach the landings in the coal region—for want of adequate facilities there—to that of delivering the cargo in New York, or Albany, and at every other point on the route, where a steam tug, or a change of towage is required.

It is true that the increased cost of coal consequent on these delays will be one-half less per ton with the large boats, than it was formerly with the old ones. But still, they are serious drawbacks on the trade, and on the company's prosperity, and call for due exertion to procure their dissipation.

The actual cost of transporting coal by the large class of boats, including hire of the boats, and wages and food of men and horses, will be nearly *four cents per ton per diem* during the time that the boat is manned and equipped, whether it be actually in motion or at rest.

If the voyage to any point and back again to the coal region consume ten days, the cost of freight will be very nearly 40 cents a ton.

But if the voyage which ought to be made

in ten days, in consequence of unnecessary delays and impediments, actually consume fifteen days, the cost of freight will be enhanced about 20 cents a ton, or raised from 40 to 60 cents.

It is the intention, as it is the duty of the Board, as far as lies in their power, to remove all causes of delay not necessarily incident to the trade, and endeavor to smooth the way to the most expeditious and economical mode of conducting the vast traffic which it appears to be the destiny of this improvement to accommodate.

The first step towards carrying out this intention, is obviously the preparation of suitable landings, for transferring the coal with the least possible loss of time and labor, from the cars to the boats. This work is now in progress, and will be urged forward with the utmost rapidity.

To keep the levels well filled, so that the boats may be fully loaded, and to give proper despatch in passing the locks, require a vigilant administration of the line, which it is for the Board to enforce.

Next in importance, is regarded the provision of an efficient system of towage between the Schuylkill and the Delaware, by means of which all boats seeking the work may be passed up and down with little delay, and at the least possible cost, and all vessels trading on the Schuylkill may meet with prompt towage, at low rates.

After reaching the Delaware, the boats can no longer be considered under the eye or control of the company. But it is important, nevertheless, that means should be found to expedite the transit between this city and New York, where the trade meets with numerous and most unnecessary embarrassments.

Finally, it is the hope that by means of proper encouragements—possibly by allowing drawbacks, or abatements of toll in favor of those who make quick trips—a motive may be given to induce despatch at the wharves of New York, and other ports accessible to the Schuylkill boats, where the greatest detention now has place.

The importance of such efforts will be apparent from the fact, that a trip from Pottsville to New York, and back again, which ought to be made in about 12 days, and at a cost, exclusive of toll and towage, of 50 cents a ton, would actually require, according to old experience, 18 or 20 days, and cost, with the new boats, 75 cents a ton.

Taking former experience as a guide, and allowing the usual charges for toll and towage to the Delaware and Raritan canal company, the actual cost of freight from Pottsville to New York, with an adequate supply of large boats, will be about \$1 35 a ton.

This is a great reduction from the prevailing rates of former years; yet by improved arrangements, and holding out strong inducements for despatch, it is hoped materially to reduce this cost, and give greater margin for profits to the boatmen, and further development to the trade.

We have already alluded to the indications which past experience afford of the probable

future consumption of coal in this country. The subject is of primary interest, and we may, therefore, venture still to add some reflections upon the causes which are now at work to extend this consumption.

In estimating the probable growth of this trade, we must, to some extent, endeavor to free our minds from the shackles of old opinions, and the influence of ancient example. We must learn to feel the truth, that we live in an age which bears little resemblance to the past, and the progress of which cannot be safely judged by the history of the past.

This is essentially the age of commerce and of steam—the foundations of which are our coal mines.

In the machine shop and factory—on the railroad and canal—on the rivers and the ocean—it is steam that is henceforth to perform the labor, overcome resistance, and vanquish space. And it is not for human intellect to assign a limit to the application of this power, in a country like that which it is our fortunate lot to inhabit—intersected by noble rivers, and penetrated by numerous bays—with an extensive sea board, lined by flourishing cities, and possessing, along with boundless enterprise, all the elements of national wealth.

But, look where we will, the evidence of the truth that we live in an age of which the progress is not to be measured by examples from the history of the past, is prominent before us.

Taking the iron trade as an example, we find that the mere increase of the production of this metal, in the valley of the Schuylkill alone, during the past 18 months, exceeds the entire production of all the furnaces of Great Britain 90 years ago. The manufacture of cotton in Great Britain, which has increased about one hundred fold in the last 70 years, and of the same, and many other articles, as well in Europe as in this country, exhibits results almost equally striking.

There was, in fact, no appreciable iron trade, and, indeed, but little trade at all, in the present ordinary use of that word, anterior to the introduction of the steam engine—an instrument of power, deriving its efficiency almost entirely from coal, which, through its agency, has given birth to modern commerce, to modern enterprise, and a mighty impulse, too, to modern civilization.

A quarter of a century ago—within the memory of almost all here present—those magnificent boats which now give life to the Delaware and Hudson—the seven or eight hundred which traverse the Mississippi—and the thousand which circulate on other waters of this country, had no existence, except, perhaps, in the imaginations of those who were then considered wild and visionary enthusiasts. Now every year brings forth new specimens, each in its turn regarded as the noblest creation of bold invention, and each week presents some new enterprise, by which the Atlantic cities are brought into closer connection with each other, and with foreign ports.

The use of this power on the ocean has but just commenced, yet enough has already

been accomplished to point to an approaching revolution in the coasting trade and foreign commerce of all countries. The next year promises to witness new lines of ocean steamers, connecting this country with England, France, Germany, South America, and traversing the coast from New York to New Orleans.

A quarter of a century ago, and there were not more than a thousand tons of anthracite annually raised and exported in all this Union; now the increase alone is more than a thousand tons per diem, and compounding rapidly upon that.

But still we can form no accurate estimate of the future increase from the past. New elements are daily introduced in the problem, of which no human intellect can determine the value.

The introduction and extension of the railway system over all Europe, and even Asia—over this continent and the West India Islands—over Russia, and even into the Papal states, offer a guarantee of a future consumption of iron and coal, and all the chief mineral products of the earth, to which no bounds can be assigned.

Each railway requires iron for its track, engines, cars, and frequently for its stations. Each new steamer requires coal to drive it—iron for its engine, and sometimes for its hull—and five tons of coal for each ton of iron it consumes.

Every steamboat that is launched, and every road that is forced into the interior, give birth to new enterprise, new wants, and new commerce.

The manufacture of the iron, and the propulsion of the machinery, require coal; the quantity increases with the expansion of the railway system; the system extends the area of civilized population, and consequent agricultural wealth: This wealth needs transportation, and this transportation again needs coal and iron.

In this country, peculiarly, the consumption of this fuel is increasing with the general increase of population where it is used—with the wider area over which it is used—with each new purpose to which it is applied—with the growth of every description of manufacture requiring power—with every new improvement by which the cost of its conveyance is diminished, and with the extension of inland, coast, and ocean navigation.

Looking now first at the present trade—pent up and confined for the want of means of conveyance—and at these obvious causes of a vast future increase—then at the fact that this improvement penetrates the centre of the anthracite district, and will offer unrivalled facilities for direct and cheap conveyance to distant markets, it is the deliberate opinion of the Board, that the demand will not only immediately exceed the quantity needed for the ample remuneration of the company's exertions, but speedily swell to an extent that will require the utmost possible increase of the capacity of their works.

By order of the Board,

CHARLES ELLET, JR.,

President.

## NOTES.

**Note 1.**—There are but three levels on the whole navigation which have not been tested during the season with a depth of 6 feet. The least depth in any one of these three levels was 5 ft. 6 inches. These will all be prepared for 6 feet during the winter, and it is hoped that that depth can soon be permanently maintained throughout.

The increased depth has been obtained in nearly all the pools by raising the dams. In the few cases in which it is to be ultimately obtained by dredging, the dams have only been temporarily raised.

**Note 2.**—The increase of the anthracite trade for some years to come, appears likely, from these facts, to average not less than 600,000 tons.

If we assume that the Schuylkill navigation company, with all the advantages of their enlarged work, will obtain *but one year's increase* of this trade, at a charge of 60 cents a ton for toll, it will yield them an annual revenue of \$360,000, or 6 per cent. on an investment of \$6,000,000.

The company have resources in their miscellaneous tonnage and rents, sufficient to meet all current and probable contingent expenses.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PLANS.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**LAP-WELDED WROUGHT IRON TUBES**

for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**SPRING STEEL FOR LOCOMOTIVES.**

Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**A. & G. RALSTON & CO., NO. 4**

South Front St., Philadelphia, Pa.  
Have now on hand, for sale, Railroad Iron, viz: 180 tons 24 x 1 inch Flat Punched Rails, 20 ft. long.  
25 " 24 x 1 " Flange Iron Rails.  
75 " 14 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

THE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

TO THOSE INTERESTED IN Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arrester have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

FRENCH & BAIRD.

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.

The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston.

ja45

**MACHINE WORKS OF ROGERS,**

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callen-lers; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes. 10c

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellys are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellys, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellys for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
597 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4¢ =	101 25
Workmanship free of patent charge.	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45  
He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33c

## LAP—WELDED. WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address

J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y7 Maryland.

### ENGINEERS' AND SURVEYERS'

### INSTRUMENTS MADE BY

EDMUND DRAPER,

Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

Railroad Depots, etc.

ANDREW MENEELY.

West Troy, May 12, 1847.

1y21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 321y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its availability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ropes, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	8 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-2	7½
16	2½	4 3	6	8 8		10½	7-16	7

**N.B.** The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1v24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
1v25 Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents the engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
Reading, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

**THE SUBSCRIBERS, AGENTS FOR**

the sale of

Codorua,

Glendon,

Spring Mill and

Valley,

Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L. KIMBER, & CO.,**

59 North Wharves,

Jan. 14, 1846.

[1v4]

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**

43 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents,**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

**PETER COOPER** 17 Burling Slip.

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by A. & G. RALSTON  
Mar. 20th 4 South Front St., Philadelphia.

**VALUABLE PROPERTY ON THE MILL Dam For Sale.** A lot of land on Gravelly Point, so called, on the Mill Dam, in Roxbury, fronting on and east of Parker street, containing 68,497 square feet, with the following buildings thereon standing.

Main brick building, 120 feet long, by 46 ft wide, two stories high. A machine shop, 47x43 feet, with large engine, face, screw, and other lathes, suitable to do any kind of work.

Pattern shop, 35x32 feet, with lathes, work benches, Work shop, 86x35 feet, on the same floor with the pattern shop.

Forge shop, 118 feet long by 44 feet wide on the ground floor, with two large water wheels, each 16 feet long, 9 ft diameter, with all the gearing, shafts, drums, pulleys, &c., large and small trip hammers, turnaces, forges, rolling mill, with large balance wheel and a large blowing apparatus for the foundry.

Foundry, at end of main brick building, 60x45 feet two stories high, with a shed part 45½x20 feet, containing a large air furnace, cupola, crane and corn oven.

Store house—a range of buildings for storage, etc., 200 feet long by 20 wide.

Locomotive shop, adjoining main building, fronting on Parker street, 54x25 feet.

Also—A lot of land on the canal, west side of Parker st., containing 6000 feet, with the following buildings thereon standing:

Boiler house 50 feet long by 30 feet wide, two stories.

Blacksmith shop, 49 feet long by 20 feet wide.

For terms, apply to HENRY ANDREWS, 48 State st., or to CURTIS, LEAVENS & CO., 106 State st., Boston, or to A. & G. RALSTON & Co., Philadelphia. ja45

**TO LOCOMOTIVE AND MARINE ENGINE Boiler Builders.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS, Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28f

J. BALL & CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7 11-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. WALDO HIGGINSON, Agent.

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD—Distance 84 miles—**

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City. via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	\$1 00
" " " Xenia	1 50
" " " Springfield	2 00
" " " Columbus	4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47th W. H. CLEMENT, Sup't.

**PATERSON RAILROAD**

Summer Arrangement.  
Commencing April 20th, 1847, the cars will leave

Paterson at	New York at
8 o'clock a.m.	9 1/2 o'clock a.m.
11 1/2 o'clock a.m.	12 1/4 o'clock p.m.
4 o'clock p.m.	5 1/2 o'clock p.m.
On Sunday.	
8 o'clock a.m.	9 1/2 o'clock a.m.
4 o'clock p.m.	5 1/2 o'clock p.m.

Returning, leaves Owing's Mills at.....7 a.m.  
D. C. H. BORDLEY, Sup't.  
Ticket Office, 63 North st.

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 351y

**CENTRAL AND MACON AND WESTERN**

Railroads, Ga.—These Roads with the Western and Atlantic Railroad

of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad	190
Macon to Atlanta—Macon and Western	101
Atlanta to Oothcaloga—Western and Atlantic	80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weigh Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings	\$0 50	\$0 75

Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones	0 50	0 63 1/2
--	------	----------

On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot	0 30	0 26
---	------	------

Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot	0 20	pr. 100lbs. 35
--	------	----------------

Crockery, per cubic foot	0 15	" " 25
Molasses and Oil, per hhd., (smaller casks in proportion)	9 00	13 50

Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each	1 25	1 50
---	------	------

Ploughs, (small,) and Wheelbarrows	0 80	1 05
Salt, per Liverpool Sack	0 70	0 95

Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH to Macon. Distance 190 miles.**

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally... 50 cts. per hundred.  
On measurement goods... 13 cts. per cubic ft.  
On brls. wet (except molasses and oil)... \$1 50 per barrel.

On brls. dry (except lime)... 80 cts. per barrel.  
On iron in pigs or bars, castings for mills, and unboxed machinery... 40 cts. per hundred.

On hdds. and pipes of liquor, not over 120 gallons... \$5 00 per hhd.  
On molasses and oil... \$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston, on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily... \$26 50  
Fare through from Charleston to Huntsville, Decatur and Tuscumbia... 22 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr., Agent.

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warren, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA**

Road line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4 1/2 " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1/2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3 1/2 and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 254f

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

and Chattanooga.				0 85	0 90

1st class.—Boxes of Hats, Bonnets and Furniture per foot.  
2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cases) Drugs, Confectionaries, Shovels, Spades, Seythes, Smiths' Bellows, Baskets, Tubs, Sifters, Brooms and other light articles, per 100 lbs.  
3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheese, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casks, or Crates of Crockery, Hardware, and other heavy articles not enumerated below.  
4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Linseed Oil, per 100 lbs.  
Cotton. Per 100 lbs.

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.: and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.

Chattanooga, Tenn., July 1, 1847.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAML KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### Great Western, Canada, Railway.

We give, in this number, the report of CHARLES B. STUART, Esq., to the directors, of his examinations and location of the Great Western (Canada) railway; accompanied by a map, showing its eastern and western connections. It will be seen, by referring to the map, that this road is destined to oc-

cupy a very important position in the great system of railways in this country. We shall give in our next number the Appendix to the report, which contains a mass of very interesting statistics, in relation to the business of that region of country from which this road is to draw its support.

From the report we infer that the location made by Mr. Stuart is more favorable than the most sanguine friends of the work anticipated.

### Good Examples may be Safely Followed.

The following letter expresses itself in a few words It says—

"K——. M——. September 2, 1847.

To the Editor Railroad Journal:

"Sir: I enclose \$5, for which please credit me with one year's subscription to your Railroad Journal.

Yours respectfully,

"J. M. B——."

It may not be amiss to say that this amount pays to August 1st, 1848. Who will go beyond that, and so link the Journal into the next year as to ensure its successful continuance—for many years to come?

### Tamaqua and Easton Railroad,

We have read, says the editor of the Miner's Journal, the report of John Childe, Esq., appointed to make a survey of this road, which is intended to connect New York through the Somerville, (New Jersey) railroad. The road is suggested to be located from Tamaqua through the Mahoning creek valley, to the Lehigh opposite Weis' port, and thence on the right bank of that stream through Allentown to Easton. The distance through will be 59½ miles. There will be an ascent of five feet per mile for the first four miles from Tamaqua to summit A—from thence descending 27 feet per mile for 13 miles to near Mauch Chunk. From thence to Easton it will be either level, or descending from 1 to 18 feet per mile. From thence the road will be connected by another now about being commenced, the stock, we learn, being all subscribed for. The estimated cost of single track, with 30 miles of turnouts, making in all 90 miles, is \$2,009,000. The estimated cost of equipments, including 15 locomotives, 2000 cars, tools, etc., for coal, merchandize, passengers, etc., \$745,300—total cost of roadway and equipments, \$2,760,000, or \$46,369 per mile.

The estimated amount of coal business per annum is 1,000,000 tons through at 62½ cents per ton, \$625,000. Of passengers, merchandize, way coal, etc.,

\$279,500—making a total of \$902,500. The expenses, estimated at \$475,380—leaving the total net income \$427,120, which is more than 15 per cent. on the estimated cost, etc.

### Virginia Iron and Steel.

"We had the pleasure, says the editor of the Winchester Republican, on the 16th, of visiting the works of the 'Virginia Steel Company,' in the city of Richmond, located on the margin of James river, and operated by water from the basin of the canal. The company contemplate making steel from the pig iron, which they will first refine and draw into bars of proper sizes, and then convert into steel.

We saw some beautiful samples of steel, made of iron from above the mountains; but the company found so much difficulty in procuring a ready and suitable supply of bar iron, that they suspended making steel, until they could erect works to manufacture their own iron. This they have mainly accomplished, and are about to commence both branches of their business. We observed three hammers and five refining and chafery forges, in the iron works, and others putting up. In the steel works, there are three large convertories, with rolling and hammering machinery.

Two members of the company present stated to us that all that was now lacking, were the workmen—and that the superintendent had gone to the north to hire them. We asked, why not employ our own mountain workmen? and upon further inquiry, we found that *refiners and hammer men*, are the kind of workmen needed; and that the iron will be manufactured in the old way, by refining with charcoal and drawing with the hammer. There will be neither puddling nor rolling; so that many of our mountain workmen may find work and receive liberal wages, by applying to the company. Letters addressed to Col. C. S. Morgan, Richmond, will elicit any further information needed on the subject.

We have in our possession a sample of the steel manufactured at the Richmond steel works; and if any thing from England can be produced to excel it, it must be something better than any thing we have yet seen."

It is only requisite for the men of intelligence and property of Virginia, to give their attention—their minds—to the development of the wonderful mineral resources of the *Old Dominion*, to make it what nature designed it to be—at least equal to any other State in the Union for its productions.

They must think more of business than pleasure—more of *resuscitating* their impoverished soil, than of regaining their political ascendancy. A good business man—one who cultivates the soil, or causes the earth to yield up its rich treasures of minerals, or turns those treasures into useful articles, for the use of mankind—is worth more than a score of politicians, whose main business it is to deceive, and live upon, the masses who vote.

#### Pennsylvania Central Railroad.

This important subject begins to attract its proper share of attention. Its value is not, however, as fully appreciated by a certain class—we mean the wealthy real estate holders, and the retired men of wealth, whose thousands are loaned out on bond and mortgage—we would, therefore, avail of every opportunity to lay before them important facts and arguments, bearing upon the subject, calculated to convince them that it is their *interest*, as well as their duty, to aid in the immediate construction of the Central railroad to Pittsburg; and then to contribute largely to its extension westward, *to*, and *through*, Ohio, in accordance with the plan proposed by Mr. J. A. Roebling, in the Journal of February 27th and March 6th. The views of Mr. Roebling are well sustained by an intelligent and liberal-minded gentleman, who has recently passed through that region of country, to become better acquainted with its resources and its people, and who has given the result of his observations in a series of letters published in the *North American and United States Gazette*, of this city, from the first of which we make the following extracts, and ask for them the attention of all those who are interested in the Central railroad.

"I had intended to ask the attention of your readers to points vitally important to our interests, rather than indulge in mere details of the road. At New York the number of familiar faces who formerly made their purchases or passed a portion of the season in Philadelphia, afford food for inquiry as to the cause of a change, which at once fills her almost innumerable hotels with profitable customers, and so seriously affects our home trade, as well as foreign commerce. This may be readily found in the wise policy of New York in improving her vast natural advantages, and stimulating every avenue of trade and travel, while we have supinely abandoned the field to our energetic competitors—sinking untold millions in worthless stocks, instead of investing them for the preservation and extension of our once proud pre-eminence. Among the remedial measures still within our reach, permit me to suggest the speediest possible completion of our road to Cleveland and the Mississippi.

"Thousands of southern travellers who used to adopt the old fashioned modes of reaching Philadelphia, now ascend the Mississippi or Ohio, cross over to the lakes, and thence via Buffalo to New York; while the route by Cleveland—perhaps the most beautiful city of the west—would afford one of superior interest to Philadelphia, and save 300 miles needless travel! It is a most mortifying fact that throughout the west and southwest, every one speaks of Boston and New York—while Philadelphia is rarely mentioned. Our churlish capitalists clamor at the aid wisely granted by our councils to this sheet anchor of our hopes, and our fashionables vegetate among the vanities of the watering places. Meanwhile Boston has advanced her millions in buying up and completing the railroads of Ohio, Michigan, and the far west; while the sagacious inhabitants of the eastern cities, often accompanied by their wives

and daughters, extend their journeys into these new States—examine, and supply their wants, expend their capital in judicious investments, intermingle their interests, and form social ties with their influential citizens. Let Philadelphia follow these wise examples, and while her citizens would be delighted at the beauty of the new world here developing its mighty resources with giant strides, they would begin to appreciate the necessity of seeking to share in the golden harvest.

"At Galena, we were told their export of lead alone exceeded two millions in value, and that the annual transactions in exchange of one of her citizens reached \$4,000,000. The approach to St. Louis the emporium of this region, struck us with surprise. About 60 steamers were moored at her quays; long lines of noble warehouses stretched along the bank, in the rear of which the varied forms of industry—sugar refineries, furnaces, foundries, shot towers, white lead factories, etc.—gave evidence of great energy and enterprise. One leading merchant assured us that during the past season, the daily export of lead, hemp, flour, corn, provisions, machinery, etc., often reached 15 to 20,000 tons. New Orleans has told us how justly she appreciates the effect of our rivalry in the mighty tribute she now monopolizes from this region. Push your *back bone line* at once to St. Louis and Cincinnati, and a stream of travel and commerce will richly repay the cost of outlay, and astonish the millionaires, who may find their idolized real estate, in default of this great desideratum, sinking in value beneath taxation and the successful rivalry of more enterprising cities. While much of our city property has remained stationary, or worse, for years, owing to these causes, St. Louis, Cincinnati, and even Dayton, can point to fortunes of one or more millions, the result of rapid rise in real estate. One of these instances at St. Louis, was the case of an officer who was induced to invest \$800 in land. This has risen so rapidly, that he now derives an income of \$35,000 from the ground rents created out of it. One of our most estimable citizens was persuaded to buy a few acres adjoining, for a trifle, which will secure a fortune to his children. Had we possessed the means of communication with these new cities, and the enterprise to have placed judiciously business branches in them, Philadelphia fortunes to a vast extent would have been realized. Now they have created so much capital for themselves, and introduced such a variety of manufactures, that unless Rip wakes up and puts forth *arms of iron*, to clasp them to a closer embrace! they will soon become totally estranged from us, and derive their partial supplies from New Orleans, N. York and Boston. Among the items of produce received last year by the former city, may be noticed 46,303 hogsheads, 369,601 barrels and 10,233,452 lbs. pork in bulk; 107,637 bbls., 334,969 kegs lard. One half of this, to say nothing of her oceans of flour, corn, wheat, beef, lead, tobacco and hemp, and which your '*back bone line*' would attract to Philadelphia, could not fail to double our foreign commerce. • •

"But we must press this work *beyond* Pittsburg. The people of the west complain bitterly of the vexations and exactions they suffer there. Instead of permitting their produce to proceed to an eastern market direct, for the sake of a pittance of drayage, storage or commission, their casks are thrown about in the mud at a minimum loss of 25 cents for mere defacement, even if they escape more serious injury—added to which the enormous exactions of the carriers, (\$3 per bbl. for flour, and 54 cts. per bush. for corn, which is 150 per ct. beyond the present value of maize here!) have drawn from Philadelphia a

half a million of barrels within the current year! Our capital has chiefly constructed the Pennsylvania and Ohio canal; and from the same pernicious and ruinous policy, we have been assured that its usefulness and consequent profit have been destroyed—she availing herself of it to send her own manufactures westward—but effectually driving the produce of the west to seek the more distant and circuitous routes via Buffalo and the Mississippi. Her suicidal policy is every day becoming more ruinous to us, as the great capitals, now nearly complete across Illinois, Indiana and Michigan, will open new channels to New Orleans, to the vast injury of each.

"Let, then, Pittsburg unite in extending the benefits of our proposed railroad to the Mississippi and the upper lakes, upon principles of enlightened liberality, and she will share richly with us the mighty stream of commerce now unfortunately drawn beyond the reach of both, to the more distant ports of New Orleans, Boston, and New York. • • E. C."

#### Great Western (Canada West) Railway Report.

To the President and Directors of the Great Western Railway Company.

GENTLEMEN,—In submitting to your Board a report on the great work which it has been my duty to locate, I feel compelled to admit my inability to do justice to its unrivalled claims either as a national or commercial enterprise.

The stockholders of this company control the destiny, and may appropriate the profits, of a line of railway two hundred and twenty-eight miles long, under a liberal charter, with a right to exact toll without legal restriction, to make various important branches—running through a district of country highly favored by nature, and occupying a site, which, for the attainment of speed, and the future economy of working, is unsurpassed in this country or Europe.

Commencing in the west, at the head of Lake Erie, where daily steamers connect it with all the shores of the great upper lakes, and the fertile lands of the north western States, and a railway now nearly finished, completes the line through the heart of Michigan,—touching in its route, and by its tributaries, at convenient ports on Lakes St. Clair, Huron, and Ontario,—and terminating in the east, on Niagara river, where two railways and a noble canal form its continuation to New York and Boston; and Lake Ontario and the St. Lawrence furnish an independent channel to Montreal and Quebec—this work seems destined to absorb the traffic of a wider region than often falls to the share of any single enterprise.

All these great tributary trunks, radiating from the eastern extremity of your line, to every prominent point on the New England seaboard, and westwardly almost to the confines of civilization, are now finished, and many of them among the most productive of the works of internal improvement on the continent; while your road concentrating, and in a great measure absorbing, the traffic of all, is the unfinished link in the greatest continuous chain of railway communication in the world.

This immense chain, attracting in its course, numerous tributaries, extends from Portland to Boston, thence westwardly to

Buffalo and the Falls of Niagara, Detroit, Chicago, and on to the valley of the Mississippi—all the links of which, over a space of seven hundred miles eastwardly, are finished, and to the west, nearly one hundred and fifty miles are in operation, and the remaining portion under contract, or on the point of commencement.

And such is the fortunate position of your improvement, that it must form an essential part of another great, though more northern line, commencing at the head, and extending along the Canadian shores, of Lake Ontario, through Toronto and Kingston, and thence on the borders of the St. Lawrence river to Quebec and Halifax; with branch lines reaching out from Oswego to Syracuse, from Cape Vincent to Rome, from Ogdensburgh to Boston, and from Montreal to Portland; portions of each of which are now in progress of construction.

It is not professional skill that has placed the location of your railway on the precise ground that will enable it to control the trade and travel of such a vast portion of the Canadas and the prosperous American States, east and west of its termini. It owes its value and all these incomparable advantages, to the physical formation, and great geographical divisions of the country.

The direct line of travel from the Atlantic coast of the New England States, to the Mississippi, has been controlled by that distribution of hills and valleys, which formerly ruled the location of the Erie canal, and conveyed that work due west through the central and richest portions of New York—in a region where great cities have since grown up, and the highest grade of national prosperity has been already approached.

This line of trade and travel has been brought to the Niagara frontier, a little south of the western end of Lake Ontario, and a little north of the eastern end of Lake Erie, where nature seems to have provided for its further progress by bringing the opposite cliffs so near together, that it is practicable there, and there only, to pass over all the waters discharged by the cataract of Niagara, by a single arch.

This westward line cannot be deflected to the south, for Lake Erie lies in the way; and it cannot diverge to the north, for Lakes Ontario and Huron intervene in that direction. It must pass between the lakes, below the falls, and along the succession of valleys and level plains which are found in the same parallel, and pursuing the same direction in West Canada. It cannot deviate from this course until it again encounters the narrow channel that connects the northern lakes with Lake Erie, and that separates Canada from Michigan.

After passing this channel, the same succession of level plains is continued into the fertile and almost boundless region known as the VALLEY OF THE MISSISSIPPI,—that immense field which is now absorbing the surplus population of the kingdoms of Europe, and increasing an influence of wealth with a rapidity that has hitherto been without a parallel in the history of the world.

It is this work—connecting with these inexhaustible feeders, and hereafter to furnish the means of intercourse between the States which are east, and the States and territories west of Lake Erie—that it has been my duty first to explore, and subsequently to establish, by extensive and accurate surveys. It is a work running through the western peninsula of Canada, which depends for its support (as will be hereafter exhibited in greater detail):

1st. On the trade and travel of the St. Lawrence and Lake Ontario, brought from the east by numerous steamers, to the mouth of the Niagara river, and to the city of Hamilton, at the head of the lake:

2d. On that of the State of New York, brought by the Erie canal to the foot of Lake Erie, and Niagara river near the falls:

3d. On that brought by existing railways, from the cities of New York and Boston, and the other ports of the New England States, through the centre of New York to Buffalo and Niagara Falls, destined for Michigan and the north western States:

4th. On the traffic and travel brought by steamboats from Lakes Michigan, Superior, and Huron, to the western termini of your road:

5th. On the trade and travel of the States of Michigan, Illinois, and the Mississippi valley, brought to the same point by the Michigan Central railway, soon to be completed to Lake Michigan opposite Chicago.

These are the great contributors to the support of your work—the lines already in activity which diverge from its extremities towards the east and west—quite independent of the wealth and resources of the immediate district traversed by the improvement itself—by far the most populous and fertile portions of Canada West—which this line *must* control without rival, or the probability of future rivalry.

Ample surveys, which have been extended over every route, offering any pretension to authorize its exploration, have led to the conclusion that there is no appropriate ground on which to place a competitor on either side of that which has been recommended for your adoption.

The "Pelham Heights" and deep ravines cutting through the Queenstown Ridge, prohibit a location on the table lands south of Hamilton, to reach Niagara Falls,—an idea once seriously entertained, but finally dispelled by the examinations recently completed.

The result of the extensive surveys which I have conducted, with explanatory charts and profiles and estimates in detail, have already been submitted to your Board in my report as engineer of location. I have therefore now only to exhibit the characteristics of the line, which, on the authority of these surveys, I have recommended for the definite location of the Great Western railway, and those evidences of its future success which, in my view, demand its construction.

#### LINE OF LOCATION.

The annexed map exhibits the line of location, from the site of the proposed suspension bridge over the Niagara river, to Windsor,

opposite the city of Detroit, crossing the Niagara, Gore, Brock, London, and Western Districts of Canada West, and passing through the city of Hamilton and town of London, agreeably to the provisions of the charter. It exhibits also, the branch to Port Sarina, at the foot of Lake Huron.

In the location of the work, careful surveys have been made of the country between the Niagara and Western frontiers, embracing nearly fifteen hundred miles of instrumental examination, and resulting in reducing the length, and improving the gradients and curvatures of former surveys in a remarkable degree; a saving of thirteen miles having been effected in the aggregate distance, and the maximum grade, previously established at eighty feet having been reduced to forty-five feet per mile.

On the whole distance of 228 miles, over 217 miles is perfectly straight, and the length of the located line, differs less than four miles, from an *air line* drawn between the same points. (See note A.)

I know of no case in this country or elsewhere, comparable with this, and it is doubtful whether another location of the same extent can be found on the continent, so well adapted to the attainment of high velocity, and great economy of transportation.

**Gradients.**—On a long line of railway, forming a link in an extended chain of communication, where great speed and punctuality are essential, easy gradients are of the highest importance.

A reference to the annexed map and profile shows that there is but one summit between the waters that flow into Lake Ontario, and those flowing into the Thames, Detroit, and St. Clair rivers, and that the approach to this dividing ridge is through valleys which afford long and gentle slopes for reaching its summit.

The belt of country extending from the Hudson to the Mississippi, through the centre of New York, Canada West, and Michigan, is the most even and uniform that is to be found in any parallel between the western waters and the Atlantic coast.

This entire distance of nearly one thousand miles, may be traversed along the valleys of rivers, over extended plains, or on the shores of lakes, without interruption from any considerable range of hills.

The gradients of the line will compare favorably with those of any railway of the same length in Europe or America. Approaching from the west, the summit, three hundred and sixty feet above the western terminus, is reached by grades of twenty feet per mile: going from the east, the maximum grade is forty-five feet per mile, and the whole length of this grade is found in a space of twelve miles. (See note B.)

The maximum grade is considerably below that of all the railways in the United States, designed as great thoroughfares between the "west" and the seaboard; and much below many of those on the line between Albany and Buffalo, a district of country remarkable for the evenness of its surface.

To sum up the general results briefly, it

will be seen by reference to the tabular statements, that the line of location presents the remarkable feature of having *ninety-five per cent.* of the whole distance in tangent lines, and two-thirds of the remaining *five per cent.*, on curves of which the radii vary from 5,730 feet to 11,560 feet: while 183 miles is either entirely level, or exhibits inclinations of less than five feet per mile, and 54 miles presents slopes of less than 20 feet per mile.

There is no grade on the Port Sarnia branch exceeding 10 feet per mile.

**Right of Way.**—The right of way has been gratuitously released for a distance of nearly one hundred and eighty-two miles, embracing *two thousand four hundred and sixty-four acres* of land, exclusive of ground given for "depots."

From the liberal spirit of the charter, which allows benefits to offset damages, and from the great interest manifested by the landholders generally throughout the entire line, in favor of the work, it is anticipated that most of the remaining portion will also be obtained without expense. The item of land damages, therefore, has not been included in the estimates of the cost of the work.

**Depot Grounds and Buildings.**—Suitable grounds for passenger and freight depots, have been donated to the company, in nearly all the important towns and villages on the line, and also at both of the western termini of the railway, at Windsor and Port Sarnia, amounting in the aggregate to over two hundred acres. In all instances adequate provision has been made in procuring sites for stations to cover the present, and probable future, business of the country.

The plans and estimates for the various depot buildings and necessary shops, have been prepared with a view to the erection of substantial and durable structures of stone or brick, sufficiently extensive to accommodate the anticipated trade and travel for several years after the completion of the work.

**Wharves.**—The grounds given the company for the construction of wharves and docks, to accommodate the business of the lakes, are ample, presenting a front of nearly one mile on the waters of Burlington Bay at the city of Hamilton, of one-third of a mile on the Detroit river at Windsor, and of about the same extent on the St. Clair river at Sarnia.

The estimates of cost include permanent wharves at Hamilton, two thousand feet in length, at Windsor (opposite the eastern terminus of the Michigan Central railway) of one thousand feet and at Port Sarnia of five hundred feet.

**Plan of Construction.**—The estimates are made for a single track, with turnouts at proper intervals.

To provide for a thorough drainage, the cuts are estimated for twenty four feet, with side ditches five feet wide. The embankments are fourteen feet in width on top, and proportionally wider, where they exceed twenty-five feet in height.

The road bed is to be covered with a ballast of coarse gravel or broken stone, two feet

in thickness, on which white oak ties, six by twelve inches, and eight feet long, are bedded, at intervals of thirty inches from centre to centre.

On these ties is spiked an iron rail, of seventy pounds to the yard, on the central division, and sixty pounds to the yard on the eastern and western divisions, and the Sarnia branch. These rails are firmly secured at the joints, by cast iron chairs of twenty-five pounds weight.

The culverts, viaducts, and bridge abutments, are intended to be of permanent and durable masonry. The grade line through all the towns and villages on the route, and at all the public roads and farm crossings, has been established, so as to allow the travel to pass over the railway by bridges, or under the track by culverts,—an arrangement necessary to remove the danger of collision on a work intended for frequent trains at high velocity. The estimates provide for a substantial fence five feet high, free from bars or gates, on both sides of the track.

**Estimated Cost.**—In making the estimate of cost, great care has been taken to ascertain with accuracy the quantities of earth and rock to be removed or procured for the formation of the road bed, and the quality of the materials to be excavated.

The principal streams have been sounded for the foundation of the culverts, viaducts, and bridges, and the quantity of masonry in the different structures has been calculated from special plans made for each locality.

The prices adopted have been derived from the actual cost of works of similar character in the United States, but to which has been added a liberal per centage for incidental expenses, and interest on the instalments during the construction of the work.

The soil throughout the whole distance from Niagara river to London is generally composed of sand and gravel, well adapted to the formation of a substantial and durable road bed.

West of London the soil is more mixed with clay, but gravel ridges are still found at convenient intervals to furnish an abundance of dry material for ballast.

The cost of stone and timber has been carefully ascertained at the different points where heavy masonry and bridges are required, and the utmost confidence is felt, that the quantities and prices are sufficiently liberal to meet every probable contingency.

The line touches several points where vessels can deliver iron, and thus save much expense in its distribution.

It may be noticed that railroad iron, delivered in Canada, costs *five pounds less per ton*, than the same quality and pattern, manufactured in, or imported into, the United States, making a difference in favor of the Great Western railway of over £500 per mile, or an aggregate of about £125,000, or \$500,000 for the whole work.

**Estimate.**—The cost of the work, by the detailed estimates now submitted, is as follows, viz:

*Eastern Division, from Niagara River to Hamilton City, 42-10 miles in length.*

Graduation as per est., etc.	\$570,048	or £142,512
Superstructure, including branches	305,640	" 98,910
Total amount	\$965,688	£241,422
Add 6 per cent. int. for 6 mo's.	98,970	" 7,245
Total cost	\$994,658	£248,667
Equal to	\$23,682	or £5,920 per mile.

*Central Division, from Hamilton City to London, 75-84 miles in length.*

Graduation, etc., as per est.	\$1,328,800	or £332,200
Superstructure, including branches	722,000	" 180,500
Total amount	\$2,050,800	" 512,700
Add 8 mo's int. at 6 per cent.	82,286	" 90,571
Total cost	\$2,133,086	£533,271
Equal to	\$27,067	or £6,767 per mile.

*Western Division, from London to Windsor, 109-95 miles in length.*

Graduation, etc., as per est.	\$602,965	or £150,741
Superstructure, including branches	1,092,500	" 273,125
Total amount	1,695,465	" 423,866
Add 6 mo's int., 6 per cent.	50,864	" 12,716
Total cost	\$1,746,329	£436,582
Equal to	\$15,875	or £3,969 per mile.

*Port Sarnia Branch, 49-85 miles in length.*

Graduation etc., as per est.	\$233,752	or £58,438
Superstructure, including branches	412,500	" 103,125
Total amount	646,252	" 161,563
Add 6 per cent. int. for 6 mo's.	19,387	" 4,847
Total cost	\$665,639	£166,410
Equal to	\$13,312	or £3,328 per mile.

#### Summary.

Division.	Length in miles.	Estimated cost.			Total Halifax currency.
		Graduation.	Super-structure.	Inter-est.	
		£	£	£	£
Eastern.....	42-10	142,512	98,910	7,245	248,667
Central.....	75-84	332,200	180,500	90,571	533,271
Western....	109-95	150,741	273,125	12,716	436,582
Main track.	227-89	625,453	552,535	40,532	1,238,520
Pt. Sarnia br.	49-85	58,431	103,125	4,847	166,410
Total .....	277-74	1,683,884	1,055,660	145,379	1,404,930

From the foregoing summary it appears that the cost of the main line from Niagara river to Windsor will be £1,238,520, or \$4,954,080, and including the Port Sarnia branch, £1,404,930, or \$5,619,720.

Should it be deemed expedient to complete the eastern and western divisions as speedily as possible, and use the Plank and McAdam road, between London and Hamilton, during the progress of the grading of the central division, the cost, as estimated, would be as follows:

Eastern division,	42-10 miles,	£248,667
Western division,	109-95 "	456,582
Total,	152-05 miles,	£705,249

It thus appears that two-thirds of the main line can be completed for 56 per cent. of the total cost of the whole, and, from the favorable character of the work on the eastern and western divisions, these portions could with economy be graded and brought into use in twelve or fourteen months. The heaviest and most costly work is found on the central division, which could not be profitably completed in less than two years.

*The Route and its Connexions.*—An inspection of the map accompanying this report, showing the route of the Great Western railway and its connexions, with other primary improvements completed and projected, will exhibit its importance, not only in facilitating the internal traffic of the province, but also as the *central link* in the extended chain of railways reaching from New York and Boston to the Mississippi river.

The completion of your railway simultaneously with the extension of the Central railway, would connect Lake Michigan with Boston harbour, and leave a break of only 65 miles to be filled to reach Chicago.

The MICHIGAN CENTRAL railway terminates at Detroit, immediately opposite the western terminus of your work at Windsor, 146 miles of which is now in operation through populous and well cultivated portions of the State; and it is already become the channel of conveyance for a large amount of products and merchandise.

This railway has been recently purchased by eastern capitalists, and is now being relaid with heavy iron, and the western portion is under contract to be completed to Lake Michigan by the fall of 1848. The earnings of this work, since its purchase in September, 1846, to the 1st of May, as appears by the company's report, were for

Freight, . . . . .	\$146,952 55
Passengers, . . . . .	60,759 89
Miscellaneous, . . . . .	1,587 66

Total, . . . . . \$209,300 10

It cost to work the road and pay for repairs during the same time, . . . . . 83,473 49

Net earnings in less than 9 mos., \$125,826 51

The receipts of this railway for the last three years in the month of May, were,—

1845.	1846.	1847.
\$15,624 55	\$32,819 85	\$41,011 76

showing an increase of nearly *two hundred per cent.* in two years.

The number of passengers carried over that road in 1846, as furnished to me by the superintendent, J. W. Brookes, Esq., was 63,228; while in 1841 the number was less than 25,000. The net earnings are now 15 per cent., of which, however, but 7 per cent. is divided, the balance going to new construction account. This company are now making docks of great extent, and a freight depot, 800 feet in length, and 100 feet in width, at Detroit, for the accommodation of produce from the west.

The importance of these results will be appreciated by those who are conversant with the position and character of this work, which can only be regarded as a future tributary of your own, since it is the *direct* western continuation of your line, which will throw off this arm towards the Mississippi, while at the same time maintaining its connexion with the upper lakes by means of steamboats from Detroit and Port Sarnia. This central road is an extension already formed, and waiting only for the completion of the Great Western railway, to pour its treasures through that

channel; while another road, already chartered and surveyed, is projected from Port Huron to the mouth of Grand river—crossing the most fertile and highly cultivated portion of the State, abounding in water power and mineral wealth, and terminating on the shore of Lake Michigan directly opposite Milwaukee, the most flourishing town in the State of Wisconsin, which, at no distant day, will be an equally important tributary to the Port Sarnia branch.

There are railways likewise projected and authorized by law, intended to connect the Central railway with Chicago, Galena, and St. Louis, and there can be little doubt that ere many years these links will also be completed.

THE PONTIAC RAILWAY, terminating at Detroit, has been for some years in operation, and well filled passenger trains run each way daily, and during the season of navigation large quantities of grain and flour are brought over the road, from the interior of the State.

There has been a charter granted to construct a ship canal (one mile in length) around the Sault de St. Marie, of a size sufficient for the largest vessels and steamers on the lakes to pass. Its completion will open to commerce the wealth of Lake Superior, the largest of all the lakes in the great chain, and induce to the speedy settlement of the lands on its borders, and render its mines and fisheries tributary to the northern branches of your road.

THE ILLINOIS CANAL, connecting the Illinois river with Lake Michigan, at Chicago, will be ready for navigation next season. From its intersection with the Illinois river, that stream is navigable for large steamers, down to its junction with the Mississippi. The canal and the river will take in their sweep almost the entire business of the State of Illinois, and connect with the Mississippi at a point where they will command most of the trade of Iowa. This navigation is nearly certain also to attract much of the business of St. Louis, and the Upper Mississippi valley.

THE EASTERN TERMINUS of your road, is at Niagara river, (where it intersects the Erie and Ontario railway, now in operation) and connects with three several railways on the opposite shore by the suspension bridge, of which the construction is to be immediately commenced.

From this point there is now, as already stated, (on the American side,) a continuous railway, leading by the way of Buffalo, to Boston and the other eastern ports; another to Lewiston, on the navigable part of the Niagara river, where steamers ascend from Lake Ontario; a third, completed to Lockport on the Erie canal, and shortly to be extended in a direct line to the city of Rochester, and there connect with railways to Albany and Boston. On the opening of this important link, the distance from Albany to Niagara Falls will be reduced *twenty-two miles*, which will make it the same as the present distance from Albany to Buffalo.

A railway is also projected from Rochester city to Syracuse, along the line of the

Erie canal, on a route some 28 miles shorter than the existing line of railway between the same points.

A railway is also under contract from Syracuse to Oswego, on Lake Ontario, to be completed in the summer of 1848; and another line has been surveyed, to connect the railway at Rochester with the New York and Erie railway at Corning, on the Chemung river,—the construction of which will direct the travel passing from New York city over the latter road, and destined to Detroit, or west of that point, to Rochester and Niagara Falls, and thence westward by your line. By taking this route through West Canada, passengers for Detroit will *save one hundred and twenty-six miles*, even after the completion of the New York and Erie railway, and the entire line of projected road along the southern shores of Lake Erie.

*Sources of Business.*—It has already been seen, that the termini of this railway east and west are converging points where the population of New York, and the six New England States, moving *west*, and that of the States of Michigan, Illinois, Wisconsin, Iowa, portions of Indiana, and Missouri, the regions of the Upper Mississippi, and Lakes Huron and Superior, moving *east*, will be drawn upon its track: that at Hamilton, it takes the whole sweep of Lake Ontario, and the St. Lawrence, and will of necessity extend its attractive influence as far as the branches now in progress from Montreal to Portland, and Lake Champlain.

We have here a population of about *two and a half millions* in the west, composed chiefly of emigrants from the east,—whither nearly all their commercial business tends, —and over *six millions* in the east, which will find your road their most convenient route.

The intercourse between two and a half millions in the west, and six millions in the east,—numbers multiplying now more rapidly than ever,—a population bound together by political and commercial relations, and the ties of consanguinity, could scarcely fail to furnish a rich reward to the enterprise of those who can command their transportation.

But without relying upon conclusions drawn from such general facts, a prudent caution would suggest that we should look to actual results on the finished works that compose a large proportion of the great chain, of which your work will hereafter be the centre, and other statistics known to be authentic.

It has been shown that 63,228 passengers were carried over the Michigan Central railway, yet incomplete, in 1846. Add to this number the passengers *passing* Detroit in steamboats, in the same year, which, as reported by J. L. Barton, Esq., steamboat agent, was 260,000, and it appears that no less than 323,228 passengers were conveyed east and west in that year.

Now, when it is observed that the transit from Detroit to Buffalo, over the Great Western, and the Buffalo and Niagara Falls railways,—a distance of 250 miles,—can be made with comfort and safety in *nine hours*;

while from 24 to 36 hours are ordinarily consumed (in the most favorable weather) in the passage by steamboats, over a lake on which the navigation is deemed, by competent judges, more dangerous than that of the Atlantic, (see note C,) the conclusion cannot be resisted, that the greater part of this travel will be commanded by your line, even in the summer season: while, in winter, it will of necessity monopolize the whole intercourse between Canada and New York, and the north western states and territories.

It will be seen by reference to note D, (page 36,) that the line of railways from Niagara Falls to the Hudson river, conveyed in 1846, more than 90,000 through passengers, and yielded an average profit of ten per cent. on their aggregate cost.

Leaving out the two short railways east of Schenectady, which, in addition to their great cost, are rival lines, the profits on the residue was nearly twelve per cent.

The Great Western railway is to be the extension of those which now terminate at Buffalo. Its length is 228 miles. If we now take 228 miles on the line from Buffalo to the east, we find a net revenue in 1846, of \$555,000, and a dividend of nearly twelve per cent., actually earned upon that distance.

The value of these roads, however,—flattering as it appears,—cannot be regarded as a just criterion for the Great Western railway, which, while presenting a much more favorable location, smaller grades, and easier curvature, will concentrate the travel of these very lines at Niagara Falls, together with all that which will be brought by steamboats through Lake Ontario from Oswego, and that which will shortly pass from Portland by the way of Montreal; and from Vermont, New Hampshire, and Lake Champlain, by way of Ogdensburgh, upon the eastern end of your work.

And in addition to these objections to the application of the results obtained on the western portions of the railways from Albany to Buffalo, it is to be observed that the conveying of freight on this line is confined to the one-half of the year,—the most expensive for its transportation, and the exaction of canal tolls, even for this privilege. And, further, the Albany and Buffalo road has for a competitor, the packet and line boats on the Erie enlargement, which carry more passengers than the railway; while, at Syracuse, large numbers are drawn towards Lake Ontario at Oswego, from which port there is a daily line of large steamers to the Niagara river and Hamilton.

The passengers which avoid the railway from Syracuse to Buffalo, by taking the Erie canal, will find the Great Western railway the cheapest and quickest route to the west; and those which diverge from it towards Oswego, will also be drawn upon your work at the Falls or Hamilton.

**Freight from the West.**—On turning to the products of the west now seeking the markets in the east, we again find evidences of present wealth and future increase, equally gratifying and satisfactory.

In 1835 the states west of Lake Erie still

imported their provisions, which were principally conveyed to them through the Erie canal.

In 1846 the exports from the west which passed through Buffalo, were:—

Flour, - - -	1,280,897 barrels.
Wheat, - - -	3,611,224 bushels.
Corn, - - -	1,179,680 "
Beef and pork, - - -	99,398 barrels.
Equal to 290,000 tons.	

This is independent of the traffic of the Welland canal, through which, during the same year, passed from the west:—

Flour, - - -	273,284 barrels.
Wheat, - - -	3,173,969 bushels.
Corn, - - -	461,933 "
Beef and pork, - - -	34,211 barrels.

The entire amount of flour, wheat, and other grain exported by the western states, through Lake Erie, in 1846, for Canada and the eastern markets, reduced to bushels, would exceed fifteen million of bushels, or 450,000 tons.

Of these exports, 781,141 barrels of flour, and 744,379 bushels of wheat, were sent from the State of Michigan, and more than half of this quantity was shipped from the port of Detroit, while a large proportion of the balance was carried from ports west of Detroit, directly past the two western termini of your road.

It is almost impossible to arrive at the entire amount of the commerce of the western or upper lakes, but sufficient authentic facts have been ascertained to show that it is already very great, and is now increasing in an unprecedented ratio. (See note E.)

The value of the exports from the port of Detroit, going east, in 1846, was \$2,495,336, and of the exports from Buffalo, going west, the same year, was \$23,199,665, and amounted to 154,761 tons.

**Way Traffic.**—The sources of through traffic only, have yet been considered.

The completion of the Great Western railway will entirely change the channel of trade and commerce, open new sources of business, and add greatly to the wealth and population of the immediate districts through which it passes, comprising more than 850,000 acres of well cultivated land, well adapted to the raising of wheat and maize, which are now extensively grown. Inexhaustible beds of gypsum and lime are found along the line of the road, and can be profitably transported to the west for a market.

The districts actually traversed by this work, contain a present population of 220,000, which for some years has been increasing at the rate of ten per cent. per annum.

At one end of the line, is the flourishing city of Detroit, with 15,000 inhabitants; at the opposite end, the great attraction of Niagara Falls, drawing its thousands of annual visitors, at the head of Lake Ontario, the city of Hamilton, with a population of 8,000 souls, increasing at the rate of 100 per cent. in five years; while the whole line is dotted with flourishing towns, more frequent and populous than those on the railways from Rochester to Buffalo.

Water power abounds along the line, which

it will be seen, by note (F) has been already greatly improved, and will of course be further developed by the completion of this road.

Plank and McAdam roads have been constructed by the "Board of works," to the extent of several hundred miles, converging generally towards the line adopted for this improvement, and over which large quantities of produce and lumber are drawn from great distances, to reach a market.

It will be observed by referring to note (G) that the exports from the port of Hamilton and through the Welland canal amount to a large quantity, and are greatly on the increase. From the port of Hamilton there was exported,

In 1845, 119,388 barrels of flour,	
In 1846, 155,298 " "	
And to July, 1847, 136,090 " "	

Total in 2½ years, 410,776 " "

**Cost of Transportation.**—The great bulk of the freight which will pass over your road will consist of the products of the west seeking the eastern markets.

The whole length of line from Detroit to the port of Hamilton being 185 miles, freight trains may make the transit at the speed dictated by true economy—not exceeding eight miles an hour—in 24 hours. They may make their trips with the produce of the upper lakes, from Port Sarnia to lake Ontario, (133 miles) at the same speed in 18 hours.

Now, the distance from this latter point—Port Sarnia—to lake Ontario near Hamilton, by the way of lake Erie and the Welland canal, is over 430 miles, or more than three times as great, and consumes an average time by steam propellers, of from four to five days, and double that time by sailing craft.

The cost of freight on flour carried from Port Sarnia to the mouth of the Welland canal, for the last two seasons, has not been less than 25 cents per barrel.

But it is well known that flour has been carried from Albany to Boston, 200 miles, over the Western road, where there are grades of 83 feet per mile, for 25 and 30 cents per barrel. And on this road, over such grades, with the Hudson river for a competitor, no less than 231,920 barrels were carried through to Boston, and 163,919 barrels to other stations on the line, in 1846, or nearly 25 per cent. more than was carried in 1845. (See note H.)

Can it then be doubted, that when the flour which is now flowing through the Welland canal in quantities almost sufficient to block up that channel, can be carried between the same points in little over one-fourth the distance, and in the tenth part of the time, required by the water route, and over grades of but 20 feet per mile, that the railway will have an ample share? And if flour is carried 200 miles on the Western railway, over 83 feet grades, for 30 cents, may it not be taken with great profit, 133 miles, over grades of 20 feet, at a much smaller price?

In fact, an analysis of the grades and curvatures of your railway, and those of the road alluded to, will show, that a locomotive which will convey 100 tons from Port Sar-

nia or Detroit, to lake Ontario, can draw but 43 tons from Albany to Boston, at the same speed; and, therefore, if 30 cents will meet the bare cost of conveyance on that work, 15 cents from Sarnia, or 20 cents from Detroit, will pay a good profit on yours.

Let it here be kept in view that next season all the ship canals around the rapids of the St. Lawrence river, will be completed, so as to permit steamers and ships of over 400 tons burden, to clear at Hamilton for any foreign port.

I would now invite your attention to the map accompanying this report, exhibiting your work with its branches and connections, and ask by what route the trade of Michigan and all the northern lakes, can pass to the ocean, as direct, convenient or cheap, as from Detroit or Sarnia by your road to the shipping port of Hamilton, and thence, without breaking bulk, by lake Ontario and the St. Lawrence to European markets.

And in connection with this route, I ask you to look at the vast shipments of grain through the Welland and Erie canals, from a country, which, ten years ago, imported a great part of the food of its inhabitants, and then judge—not what it will be ten years hence, when the hundred thousand annual emigrants now filling up the fertile regions of the "FAR WEST," shall have been changed from consumers to producers, and have begun to send off their surplus products—but what will now be the profits of your road if you obtain but a small portion even of the present trade.

Eighty thousand emigrants have already this year reached Montreal, in vessels from Europe, and in consequence of a small link in the chain of ship canals around the rapids being incomplete, (which will be finished in a few months) they are there transhipped, and ascend the St. Lawrence in steamboats and propellers.

Next season these vessels may proceed directly to Hamilton, and there discharge their passengers, and load with flour for Europe, while the emigrants can be carried westward in the return freight trains, at a very low price.

There can, under the circumstances, be no question of the ability of your road to command an abundant share of through freight. There can, in my estimation, be as little doubt of its successful competition even for that portion of the long travel for which economy is a more important element than comfort or expedition.

The through passengers who seek comfort or speed, will of course take the railways to Niagara Falls, and thence to Detroit, on your line, and avoid the loss of time and dangers of the passage over lake Erie.

Those whose choice is controlled by economy of money, and not by time, will decide at Syracuse between the railways to Buffalo, and the steamers to Detroit, on the one hand, and the railway to Oswego, steamers to Hamilton, and your road to Detroit on the other.

By the former route they will pass over  
179 miles of railway, and  
303 miles of lake navigation;  
By the latter, they will pass over

220 miles of railway, and  
160 miles of lake navigation;  
making a difference against your route of 41 miles of railway, and in its favor of 202 miles of water conveyance, or a saving in the aggregate of 161 miles of distance, or 44 per cent. on the shorter route. Can it then be doubted that the main line of travel, also, will set through the shortest channel? (See note I.

*Of the Probable Revenue.*—How shall we estimate the probable revenue of a work like the Great Western railway, to which there is nothing analogous in the history of the internal improvements on this continent?

It bears no resemblance to the railways in the States, which usually run from a seaport into the interior, and may be compared with similar works, by a comparison of the population and productiveness of the adjacent country.

*Yours* crosses a peninsula where, at one end, the products and travel of hundreds of thousands of square miles, are compelled by nature to concentrate at a single point, at the head of lake Erie; and at the opposite extremity, the merchandize and other objects of transportation are forced to converge by numerous natural and artificial channels, to an other similar point, the head of lake Ontario. Here quantities of trade and travel, unequalled elsewhere, when thus concentrated, *must*, during one half of the year, pass over this line—all other channels being closed by frost—and during the remainder, choose between the safe, cheap and direct route of your road, and the dangerous, more expensive, and circuitous passage over lake Erie.

It will be remembered that the roads leading from Albany to Niagara Falls, in 1846, earned 10 per cent. on their capital, notwithstanding the restrictions of their charters;—while the Michigan road, on the other end of your line, earned 15 per cent. on its cost.

It will also be remembered, that 200,000 persons last year passed Detroit in steamboats during the season of navigation; and that during the same period, there was exported from ports west of your railway, 3,000,000 barrels of flour, and over 5,000,000 bushels of wheat and corn.

There can be no doubt, then, that there is, and will ever be, abundance of freight and travel to transport, and it has been already shown, I think, that your route offers the greatest economy of time and money.

It seems, therefore, only important to inquire into the capacity of the Great Western railway, for the accommodation of this vast business.

I have already stated, that there is no ascending grade on the lines from the western termini of the road, to the head of lake Ontario, exceeding 20 feet per mile. On grades of this inclination, freight engines of the class now generally used, will draw a gross load of 400 tons, or trains containing 250 tons of merchandize, at a speed of six miles per hour.

If such a train were started from each end of the line once a day, they might pass in the centre, and carry 500 tons through daily—which would be equivalent to 182,500 tons

annually, or nearly equal to two millions barrels of flour. If such a train were started from each end every 12 hours, there would be required but three places of meeting, and the annual transport would be 365,000 tons.

It is not necessary to pursue this subject, for the quantity transported by two such daily lines, would be nearly four times as great as that conveyed by the Western railway in Massachusetts, in 1846, which, though an unusually costly line, pays fair dividends.

For the transportation of passengers on a road like yours, there can scarcely be a limit to its capacity.

Having endeavored to exhibit briefly the most prominent sources of business on which your railway is to depend for its support, I do not deem it necessary to enter into any speculative estimate of the quantities which it will command, or the profits which it will yield. But it can be confidently asserted, that there is no process of estimating its business results, based upon the foregoing facts, or the experience of other works of internal improvement, which will not justify all that need be claimed.

It is not my wish to make extravagant estimates of the future business of your road, or to excite unreasonable hopes of gain.

But it may, however, be useful to ascertain the number of passengers, and the amount of freight it would require at moderate charges, to support this railway.

If, then, there should be of through passengers of the first class, an average number of 100 each way daily, at two cents per mile, and of second class of through passengers, half this number daily, at one cent per mile, the yearly receipts would be \$116,000

If the way passengers should equal 50 per day each way, at 2½ cents a mile (half way) the receipts from that source would be 104,000

If the emigrants should equal 200 per day for one-half the year, at one dollar each from lake Ontario to Detroit or Port Sarnia, the receipts would amount to 36,500

Should 500,000 barrels of flour only, be carried from Detroit to Hamilton, at 20 cents per barrel, it would add to the receipts 100,000

And if the through and way freight reached only 50,000 tons, (or half a full train per day,) the yearly receipts would be, at 2 cts. per ton per mile, 228,000

Say for mails and express, 15,500

And we obtain a total of, \$900,000

Deduct from this amount 38 per cent., the average expense of the railways from Albany to Buffalo, last year, (see note D) and we have for expenses 342,000

Leaving a net revenue of, \$558,000 or £139,500, equivalent to ten per cent. on the estimated cost of the work, and over nine per cent. on the capital stock of six millions of dollars.

Having exhibited as briefly as possible the

sources from which the Great Western railway is to derive its support, the characteristics of the line of location, and the method of construction recommended, and having estimated with great care and caution the probable cost of the improvement, I now have the satisfaction to report, that the accuracy of my estimates has been fully confirmed by the judgment of experienced and responsible parties, who have contracted for the graduation and masonry of the entire Eastern Division, at prices lower than the estimate, with an agreement to take 25 per cent. of the sum to which the contract will amount, in the company's stock.

In accordance with a subsequent resolution of your board, I have advertised the Western Division, extending from London to Windsor, 110 miles, and the Port Sarnia branch, 50 miles, to be let on the 1st of October. I doubt not that all this work will be taken on terms equally advantageous and satisfactory.

With the highest confidence in the success of an enterprise which it has been my duty to examine closely, and with full assurance that its achievement will be the signal of a great change in the direction of the trade and travel of the west, of immense importance to this province, as well as to the adjacent States, I cannot but urge its immediate and vigorous prosecution to completion.

I have the honor to be, gentlemen,

Your obedient servant,

CHARLES B. STUART,

Chief Engineer.

Engineer's office, Gt. Western Railway, }  
Hamilton City, September, 1st, 1847. }

**Pennsylvania the Pioneer in Internal Improvements.**  
*The Coal and Iron Trade of Pennsylvania in 1847.*  
Continued from page 584.

Having given a brief review of the Iron Trade in Europe, we return to the history of this trade in the UNITED STATES, and more particularly to that of Pennsylvania.

In Seybert's Statistics, prepared from official documents, he states that the manufacture of iron in the United States in 1810, was as follows: 153 furnaces, making 53,908 tons of iron; 320 forges, making 24,541 tons of bar iron; 316 trip hammers, and 34 rolling and slitting mills, which required 6,500 tons of iron, and 410 naileries, in which 15,727,914 pounds of nails had been made. The value of these manufactures was \$11,361,526.

In 1818, there were in Pennsylvania 44 blast furnaces, 68 forges and 175 naileries.

In 1830, a convention of manufacturers of iron was held in Philadelphia, for the purpose of collecting information in answer to a call made upon the secretary of the treasury. They prepared the following statement, which is believed to be as precise and accurate as any statement in reference to this trade, ever laid before the public.

"The committee on manufactures of iron appointed by the convention, assembled at Philadelphia, to examine the returns received in answer to the circulars addressed to different individuals engaged in that branch of industry, report the following tabular statement as the result of their investigations:

States.	1828.		
	Furnaces.	Pig iron.	Castings.
Pennsylvania, No. 44	24,822	3,693 tons.	
New Jersey,	11	1,733	6,264 "
Maryland,	5	2,247	483 "
Virginia,	2	400	50 "
Delaware,	1	450	350 "
Ohio,			
Missouri,			

Total,	63	29,652	10,840 "
--------	----	--------	----------

	1830.		
	Furnaces.	Pig iron.	Castings.
Pennsylvania,	45	31,056	5,506 tons.
New Jersey,	10	1,671	5,615 "
Maryland,	6	3,163	1,259 "
Virginia,	2	538	43 "
Ohio,	7	5,400	250 "
Delaware,	1	450	350 "
Missouri,	2	590	250 "

Total,	73	42,868	13,273 "
--------	----	--------	----------

One furnace erected in Pennsylvania in 1830, will in 1831, make 1,100 tons of pig iron.

In addition to the 73 furnaces mentioned in the preceding table, from which detailed returns had been received, the committee had information of 129 furnaces, in the States of Pennsylvania, New York, Vermont, Massachusetts, Connecticut, Tennessee, N. Hampshire, Virginia and Ohio, in actual operation, but from them had then received no returns. Taking the production of the 73 furnaces from which returns have been received, as the rate for estimating the whole, and the following would be the result:

Years.	Furnaces.	Pig iron.	Castings.	Total.
	Number.	tons.	tons.	tons.
1828,	192	90,368	33,036	123,404
1830,	202	118,620	36,728	155,348

But as the greater part of the furnaces, not included in the returns, are situated in districts where but few castings are made, the committee have not felt authorised to estimate the quantity of castings made at them at more than about five per cent. of their entire production, which would give the following proportions and results:

Years.	Furnaces.	Pig iron.	Castings.	Total.
	Number.	tons.	tons.	tons.
1828,	192	108,564	14,840	123,404
1830,	202	137,075	18,273	155,348

From the best information the committee have been able to collect on this subject, they estimate that of the pig iron made in these years, about 10,000 tons per annum have, upon an average, been converted in the air furnaces and cupolas, into castings, leaving to be manufactured into bar iron.

In 1828, of pig iron 98,564 tons, making of bars 70,403 tons.

In 1830, of pig iron 127,045 tons, making of bars 90,768 tons.

And which quantities severally correspond with remarkable proportional accuracy with the returns from 132 forges, which accompanied the returns from the 73 furnaces first mentioned. In East Jersey, in a part of Connecticut, in a large district of New York and in Vermont, bar iron is extensively made by the process technically denominated "blooming," or by a single operation from

the ore, without the intervention of the blast furnace. The returns already received, justify the committee in putting down this description of bar iron, for the year 1828, at 5341 tons; 1830, 5853 do.; of which 2197 tons are in East Jersey, making a total of bar iron for 1828, of 75,744 tons; 1830, 96,621 do.; and the entire quantity of iron, in its first stage, as shown in the following table:

	1828.	1830.
	tons.	tons.
Pig iron,	108,564	137,075
Castings from blast furnaces,	14,840	18,273
Blooming bar iron, for the years respectively, reduced to pig iron, at 28 cwt. to the ton of bar,	7,477	8,194

Total iron in pigs and castings,	130,881	163,542
----------------------------------	---------	---------

Total increase of all kinds of iron in two years, very nearly 25 per cent.

For the purpose of determining the value of the above iron, the committee have taken the average prices of the principal sea ports, and those of Pittsburgh and Cincinnati, and have estimated that two-thirds of the bar iron made in the United States is sold in the western markets. The proportion may be greater, which would increase the entire value.

In 1828, the average price of American hammered iron, in the principal cities east of the Susquehanna, was \$105, and at Pittsburgh and Cincinnati, \$125; the average, estimated as above, would be \$118 $\frac{1}{4}$ . In 1830, the prices were 90 and \$100, giving an average of 96 $\frac{1}{4}$ . Castings from the blast furnace are valued at sixty dollars, although many sell higher; and from the furnace and cupola at 4 $\frac{1}{2}$  cents per pound, which is certainly not above the average rate.

At these prices the aggregate value of the iron made in 1828 would be \$10,861,440.

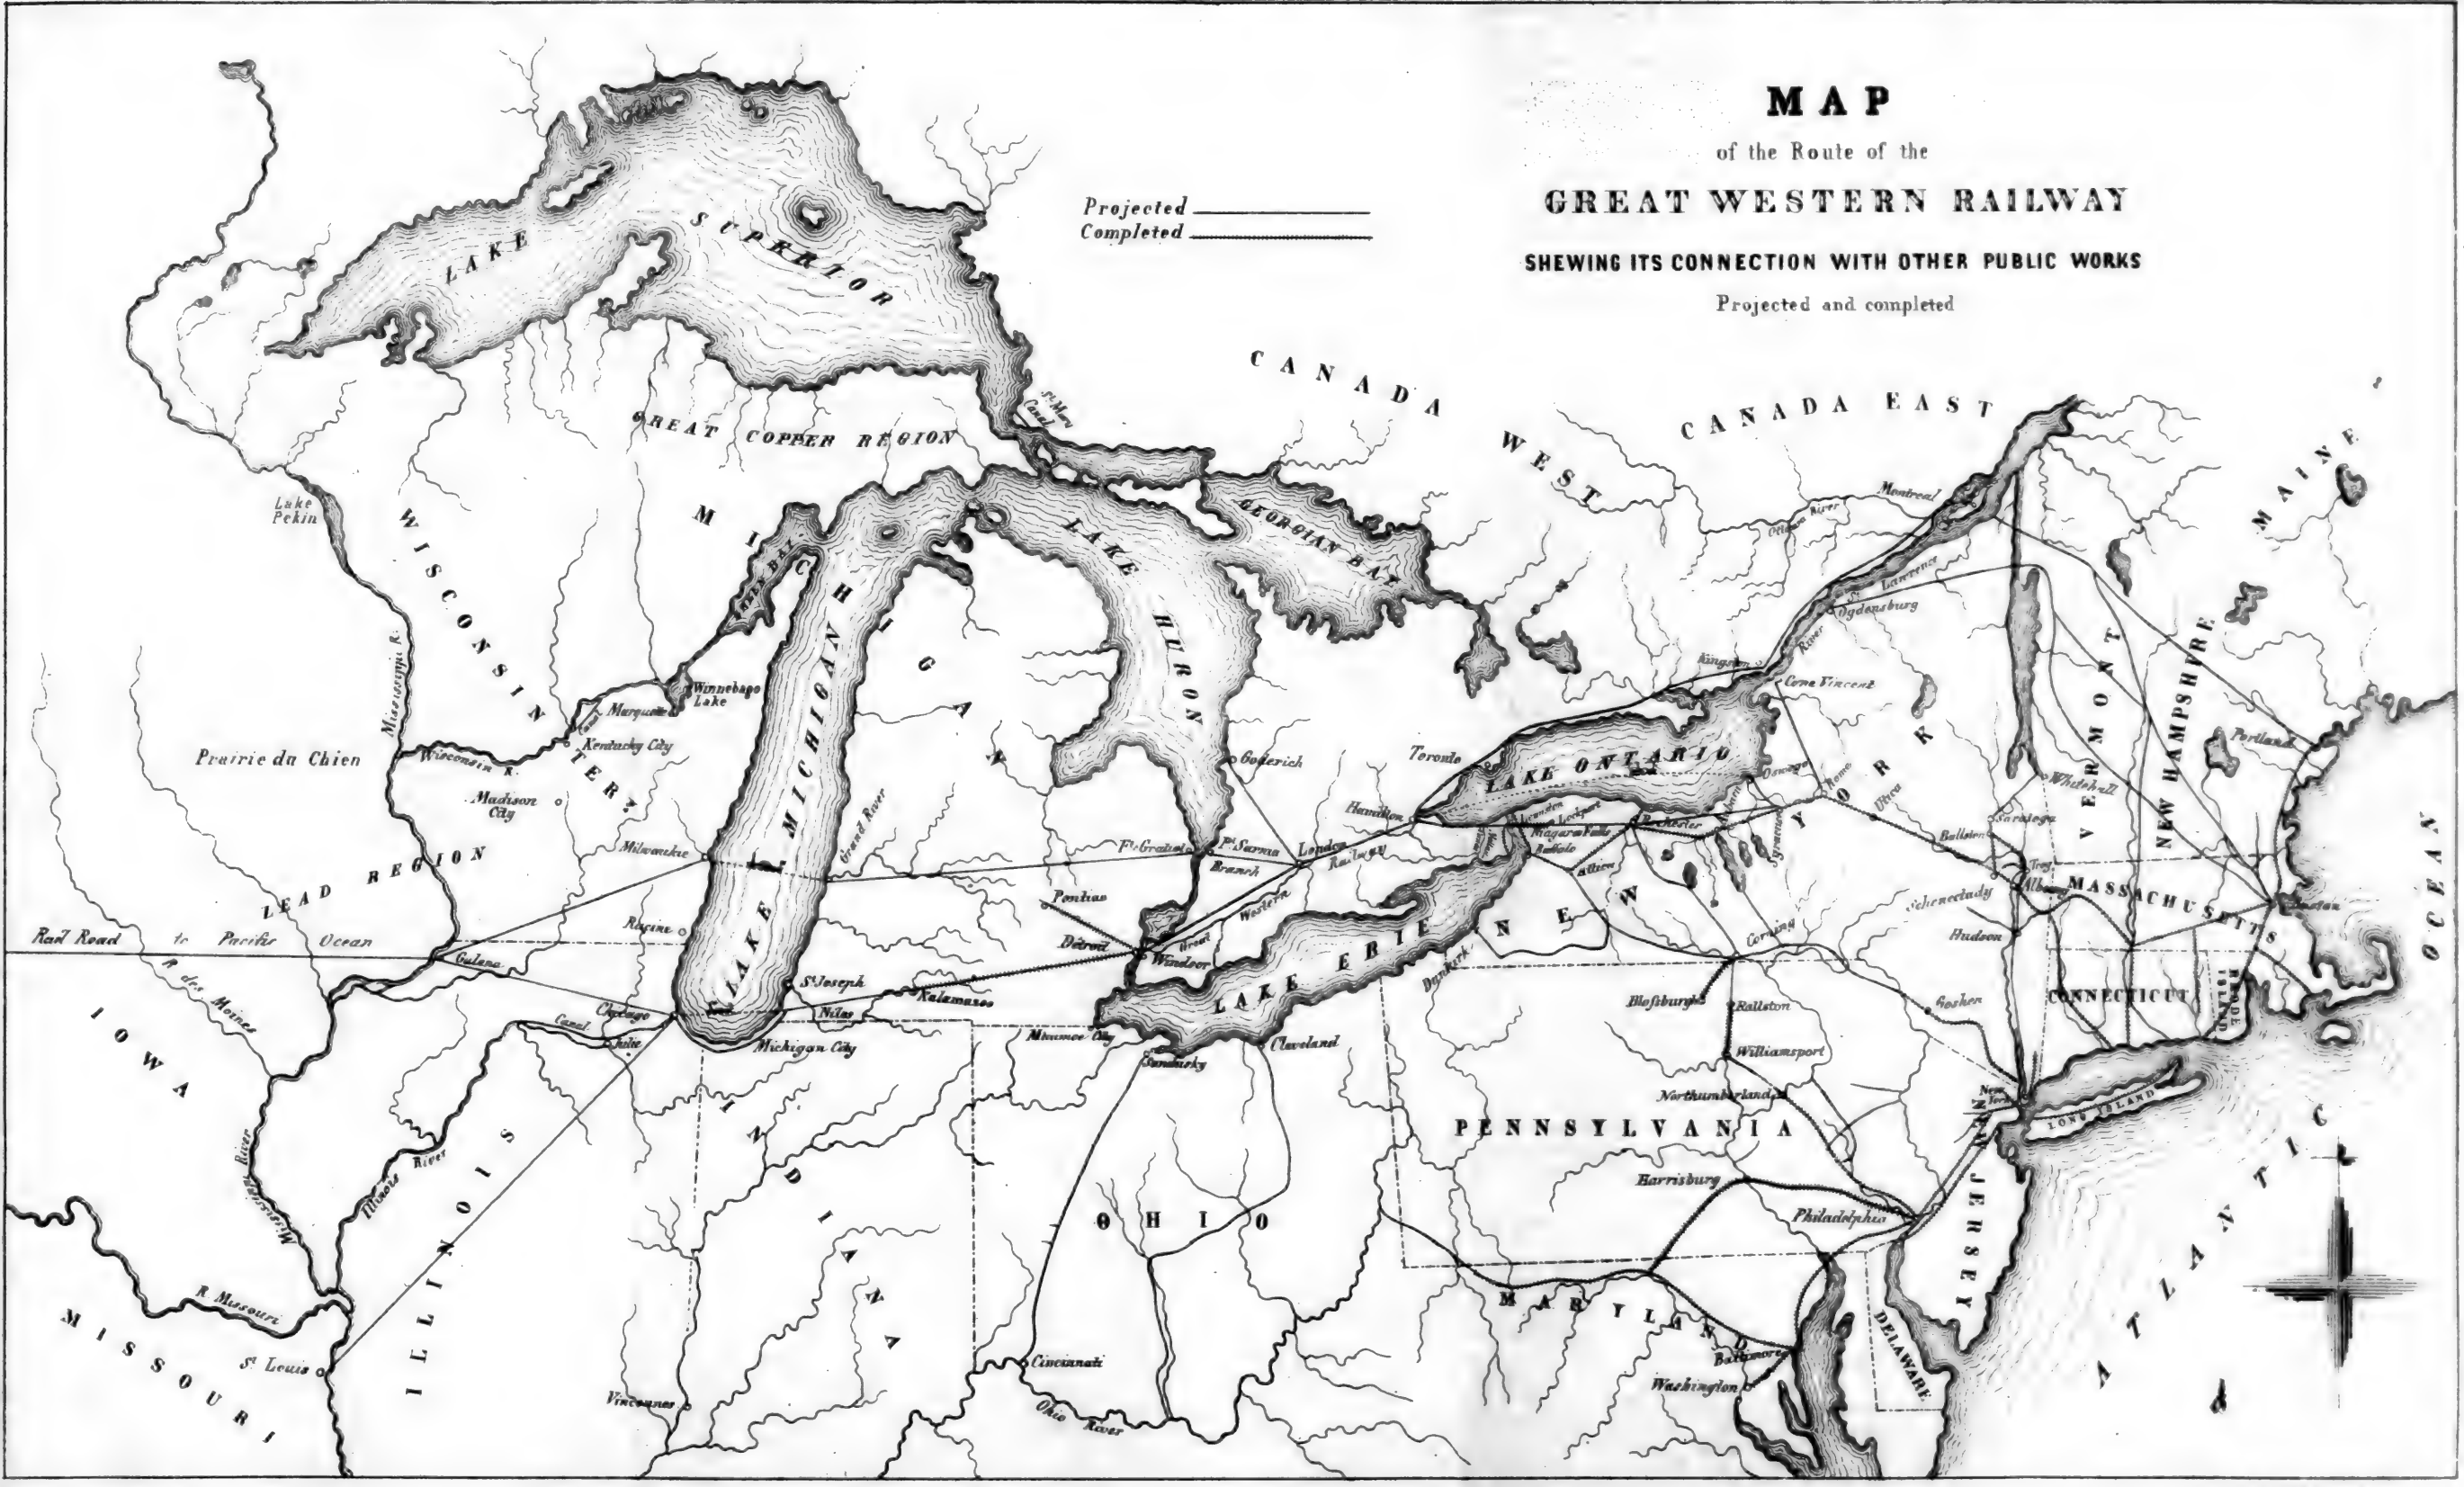

1830	11,444,410.
------	-------------

Increase in market value in two years less than 5 $\frac{1}{2}$  per cent."

We are now, therefore, led by a natural transition in this historical sketch, to give an account of the iron interest of Pennsylvania. In doing this, we shall, of course, give prominence to the anthracite iron manufacture, because in this department our State enjoys unrivalled, and almost exclusive advantages. We are so fortunate as to have obtained copious statistics, showing the wonderful progress and present extent of this branch of business in this State; and the exhibition which we shall be enabled to make, will convince our readers that, if it were not insufferably vain in any State of our sisterhood to assume the title of Empire, such priority would clearly belong to Pennsylvania.

We commence with a statement which we have prepared from the United States census of 1840. It is to be regretted that the statistics in that census are far from being of a satisfactory character; incompetent persons having been employed to obtain them. But as we have nothing more authentic for that date, we resort to the census, as affording information which may be considered as at least a basis for a general estimate.

In November, 1831, the friends of domestic industry held a convention in the city of New York, and in making their report on the iron trade, availed themselves of the information furnished by the Philadelphia convention of 1830, which they pronounced "as precise and accurate as any that had been submitted to the public." They added some new information, of which we take several items. In 1828 an addition was made to the duty on hammered iron, of \$4 40 per ton, and on rolled iron of \$7. In the following year the price fell to \$114, and in 1830 to \$96½ per ton; showing a decrease, in two years, of \$21½ per ton, in consequence of competition here; for there was no corresponding decline abroad. The prices of iron at Pittsburgh and Cincinnati at different periods, furnish data for important inferences. In the years 1818, '19, '20, bar iron in Pittsburgh was sold at from 190 to \$200 per ton. In 1831 the price was \$100 per ton. In '20 axes were \$24 per dozen; in '31, \$12. At least 600 tons of iron made in Pittsburgh, were manufactured in 1831, into various articles in that city. There were then eight

rolling and slitting mills in Pittsburgh. Thirty-eight new furnaces had been erected since 1824, in the western parts of Pennsylvania, and that part of Kentucky bordering on the Ohio river. The quantity of iron rolled in Pittsburgh was, in

1828,	3,291 tons.
1829,	6,217 "
1830,	9,282 "

Being an increase of nearly 200 per cent. in two years.

In Cincinnati, in 1814 to 1818, bar iron ranged from 200 to \$220 per ton. In

1826, bar iron assorted brought 125 to \$135  
1828, " " 115 to 125  
1831, " " 100 to 110

In 1842, when the great tariff question was occupying a large share of the public attention, a convention of iron masters assembled at Harrisburgh. Committees from various parts of the State prepared, with great labor, a mass of valuable information relating to the iron manufacture, showing the number and product of the iron works in Pennsylvania at that time, the number of hands employed, and the consumption of various articles of produce and merchandize in consequence of these operations. The intention was to show the effect of the prosperity of our manufactures in creating a home market. These results were embodied in an interesting tabular statement, and were furnished by the convention to the Commercial List for publication, and appeared in our paper of April 2, 1842. The demand for this information continuing, in 1844 we re-published the statement. In an editorial notice, under the former date, we stated that 172 works had already furnished their returns, and from 215 other works the product was estimated. These returns were embodied in the table, which we again re-publish.

The discovery of the anthracite process of smelting iron ore, was, as we have already remarked, an event of the highest importance to Pennsylvania. On the 18th of January, 1840, a dinner was given at Pottsville, by W. Lyman, Esq., on the occasion of his having successfully introduced this process. At that dinner, Nicholas Biddle, of this city, made the following forcible and appropriate remarks, which will be responded to by every true Pennsylvanian:

"And this, after all, is the great mystery, the substitution of what is called the hot blast for the cold blast. Let us see the changes which this simple discovery are destined to make. As long as the iron ores and the coal of the anthracite region were incapable of fusion, the ores were entirely useless, and the coal nearly unavailable for manufactures—while, as the disappearance of the timber made charcoal very expensive, the iron of Eastern Pennsylvania was comparatively small in quantity, and high in price, and the defective communications with the interior, made its transportation very costly. The result was, that with all the materials of supplying iron in our own hands, the country has been obliged to pay enormous sums to Europeans for this necessary. In two years

alone, 1836-37, the importations of iron and steel amounted to upwards of twenty-four millions of dollars. The importations for the last five years have been about forty-nine millions of dollars. It is especially mortifying to see that even in Pennsylvania, there has been introduced within the last seven years, exclusive of hardware and cutlery, nearly 80,000 tons of railroad iron, costing probably three millions and a half of dollars. Nay, this very day, in visiting your mines, we saw at the farthest depths of these subterranean passages, that the very coal and iron were brought to the mouth of the mines on rail tracks of British iron, manufactured in Britain, and sent to us from a distance of 3000 miles. This dependence is deplorable. It ought to cease forever, and let us hope that with the new power this day acquired, we shall rescue ourselves hereafter, from such a costly humiliation.

"We owe it to ourselves, not thus to throw away the bounties of Providence which in these very materials has blessed us with a profusion wholly unknown elsewhere. The United States contains, according to the best estimates, not less than 80,000 square miles of coal, which is about sixteen times as much as the coal measures of all Europe. A single one of these gigantic masses runs about 900 miles from Pennsylvania to Alabama, and must itself embrace 50,000 square miles, equal to the whole surface of England proper. Confining ourselves to Pennsylvania alone, out of fifty-four counties of the State, no less than thirty have coal and iron in them. Of 44,000 square miles which form the area of Pennsylvania, there are 10,000 miles of coal and iron, while Great Britain and Ireland have only 2000; so that Pennsylvania has five times as much coal and iron as the country to which we annually pay eight or ten millions of dollars for iron.

"Again, the anthracite coal fields of Pennsylvania, are six or eight times as large as those of South Wales. Of these great masses it may be said confidently that the coal and the iron are at least as rich in quality and abundant in quantity as those of Great Britain, with this most material distinction in their favor, that they lie above the water level, and are easily accessible, while many of the mines of England are a thousand or fifteen hundred feet below the surface. With these resources you would have abundant employment, if you could only supply the present wants of the country, for which we are now dependent upon foreigners. But the sphere of demand is every day widening for the consumption of iron. The time has come when nothing but iron roads will satisfy the impatience of travellers and the competition of trade.

"If coal and iron have made Great Britain what she is, if this has given her the power of 400,000,000 of men, and impelled the manufactures which have made us, like the rest of the world, her debtors, why should not we, with at least equal advantages, make them the instruments of our own independence?"

**NOTICE TO CONTRACTORS.—ANDROS-COGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Treasurer's Office in Waterville, until the 25th of September next, inclusive, for the Grading and Masonry of the 3d Division of this road, extending from East Readfield to Waterville, about 20 miles.

Also, for such sections of the 2d Division as shall not be previously disposed of.

Profiles will be ready for examination on the 20th of September, and any information respecting the line can be obtained on application to the resident Engineers.

On the 24th of September the Engineer will be at Winthrop, and will be prepared to accompany contractors over the line of the road.

HOBART CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office Lewiston, }  
August 25th, 1847. } 3137

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847. 2m32

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

##### WELDED WROUGHT IRON TUBES

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PLUM.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**SPRING STEEL FOR LOCOMOTIVES.** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**RAILROAD IRON.—400 TONS ENGLISH.** 60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
68 Broad Street, New York.

**FOR SALE.—300 TONS (10 MILES) FLAT** Bar Rail, in parcels or wholesale—section 2 1/2 inches wide by 1/2 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
Wilmington, Del.

**RAILROAD IRON.—500 TONS OF BEST** quality Bridge Rails, 53 pounds to the yard, to arrive, and for sale by A. & G. RALSTON,

No. 4 South Front Street, Philadelphia.

Also, a 2-hand Locomotive Engine, of Baldwin's make, for sale low.  
September 8, 1847. 3137

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE** Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

#### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sierns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Meritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

#### Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
ja45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2 1/2 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4 1/2 cts =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331f

### LAP-WELDED WROUGHT IRON TUBES

FOR

### TUBULAR BOILERS,

FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

### RAILROAD IRON.

#### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address **J. M. HOWE,**

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
**EDMUND DRAPER,**  
Surviving partner of  
**STANCLIFFE & DRAPER.**

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

Road Depots, etc.

West Troy, May 12, 1847.

**ANDREW MENEELY.**

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**

124f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by **JOHN W. LAWRENCE,**

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its availability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.

16	2½	4 3	6	8 8		10½	7-16	7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.

1y25

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad.  
To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28th

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily,

at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lex-

ington daily, at 8 o'clock a.m. and 2 p.m. Distance,

28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from

Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to

15th March) is 6 o'clock a.m. from Lexington, and

ma. 9. from Frankfort, other hours as above. 351

**CENTRAL AND MACON AND WEST-**

Cern Railroads, Ga.—These Roads with the

Western and Atlantic Railroad

of the State of Georgia, form a

continuous line from Savannah to Oothcaloga, Ga.,

of 371 miles, viz:

Savannah to Macon—Central Railroad

Macon to Atlanta—Macon and Western

Atlanta to Oothcaloga—Western and Atlantic

Goods will be carried from Savannah to Atlanta

and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee,

Liquor, Bagging, Rope,

Butter, Cheese, Tobacco,

Leather, Hides, Cotton

Yarns, Copper, Tin, Bar &

Sheet Iron, Hollow Ware &

Castings

Flour, Rice, Bacon in Casks

or boxes, Pork, Beef, Fish,

Lard, Tallow, Beeswax, Mill

Gearing, Pig Iron and Grind

Stones

On Measurement Goods—Boxes

of Hats, Bonnets and Fur-

niture, per cubic foot

Boxes and Bales of Dry Goods,

Saddlery, Glass, Paints,

Drugs and Confectionary,

per cubic foot

Crockery, per cubic foot

Molasses and Oil, per bhd.,

(smaller casks in proportion).

Ploughs, (large,) Cultivators,

Corn Shellers, and Straw

Cutters, each

Ploughs, (small,) and Wheel-

barrows

Salt, per Liverpool Sack

Passage—Savannah to Atlanta, \$10; Children,

under 12 years of age, half price,

Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.

Savannah, Aug. 15th, 1846.

**CENTRAL RAILROAD—FROM SAVAN-**

nah to Macon. Distance 190 miles.

This Road is open for the trans-

portation of Passengers and

Freight. Rates of Passage, \$5 00. Freight—

On weight goods generally

On measurement goods

On brls. wet (except molasses

and oil)

On brls. dry (except lime)

On iron in pigs or bars, cast-

ings for mills, and unboxed

machinery

On hhd. and pipes of liquor,

not over 120 gallons

On molasses and oil

Goods addressed to F. WINTER, Agent, forwarded

free of commission. THOMAS PURSE,

y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston,

on the arrival of the boats from

Wilmington, N. C., in connection

with trains on the Georgia, and Western and Atlan-

tic Railroads—and by stage lines and steamers connects

with the Montgomery and West Point, and

the Tusculumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery

daily

Fare through from Charleston to Huntsville,

Decatur and Tusculumbia

The South Carolina Railroad Co. engage to re-

ceive merchandize consigned to their order, and to

forward the same to any point on their road; and to

the different stations on the Georgia and Western

and Atlantic railroad; and to Montgomery, Ala., by

the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to

Oothcaloga, a distance of 80 miles, and connects

daily (Sundays excepted) with the Georgia Rail-

road.

From Kingston, on this road, there is a tri-weekly

line of stages, which leave on the arrival of the cars

on Tuesday, Thursday and Saturday, for Warren-

ton, Huntsville, Decatur and Tusculumbia, Alabama,

and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga

for Chattanooga, Jasper, Murfreesborough, Knox-

ville and Nashville, Tennessee.

This is the most expeditious route from the east to

any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846.

**NEW YORK AND PHILADELPHIA RAIL-**

road line—direct. Via Newark, New Bruns-

wick, Princeton, Trenton,

and Bristol. (Through in

six hours.) Leaving New York daily from the foot

of Liberty street.

Morning line

Mail pilot line

The lines proceed direct to Bristol without change

of cars, and thence by the new steamer, "John Ste-

vens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars

Second class cars

Passengers will procure their Tickets at the office

foot of Liberty st., where a commodious steamboat

will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each

passenger in this line, and passengers are expressly

prohibited from taking anything as baggage but

their wearing apparel, which will be at the risk of

the owner.

Philadelphia Baggage-crates are conveyed from

city to city, without being opened by the way. Each

train is provided with a car, in which are apart-

ments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the

foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily,

except Sundays, at 8 a.m., 3 1/2 and 10 p.m., and Sun-

days only at 10 p.m.—being a continuation of the

line from New York.

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## LOCOMOTIVE AND CAR AXLES.

The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,

Willow Street Wharf,

41f Philadelphia, Pa.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

HENRY M. WALKER,  
Supt. Coal Tr. P. & R. R. Co.

### Philadelphia and its Increase.

It is gratifying to us to chronicle the increase in the shipping of this port, as we do by giving place to the following paragraph, from the Shipping List:

"New Line of Packets.—It will be seen by our advertising columns, that Messrs. Richardson, Watson & Co. have made arrangements for running a new line of packet ships between this city and Liverpool. One packet is to sail from this port on the 12th of each month. With the great increase in business, which must follow the completion of the Pennsylvania railroad, it would seem to require not only the present, but additional lines of packets or steamers between this port and Liverpool—and also to Havre. Every facility must be given to the shipment of produce from this port, in order to enable us to compete with New York and New Orleans."

### Plank Roads.

The following paragraph describes the result of an enterprize of which we have heard something before.

"In company with George Geddes, Esq.," says the editor of the Cultivator, "we lately enjoyed a ride on the Salina and Central square plank road. This road, in constructing which Mr. Geddes was engineer, was completed during the past year. Its length is 15 miles. It is decidedly the most agreeable road to ride over, that we ever saw. The carriage glides as smoothly as on the frozen surface of a lake or river. The planks are hemlock, eight feet long and three inches thick, laid immediately on the earth—which is made perfectly smooth to receive them.—They keep their place without any fastening. On one side of the road there is a good ground track 12 feet wide, made exactly level with the plank, on which carriages turn out, and which in dry weather is a good road. The cost of this road—including both the earth and plank tracks—was \$1500 per mile, and it is expected the plank will last eight years. A team will carry about double the weight on this road that it will on the common roads, and a horse in a light carriage will readily go along at the rate of 60 or 70 miles a day. In sections where plank can be cheaply procured, we have no doubt that these roads will be found profitable."

Plank roads are to become important auxiliaries to railroads. They will become the connecting links between railroads and adjacent villages, on which the people will use their own teams. We shall be gratified to see them extensively introduced throughout the country, and there is no man in the States better qualified to introduce them than Mr. George Geddes.

### Boston and Maine Railroad.

At a meeting of the Boston and Maine railroad, says the Boston Courier, the following named gentlemen were chosen directors of the road for the ensuing year:—Thomas West, Andrew Pierce, Richard, W. Bayley, William F. Weld, S. A. Walker, Henry B. Stone, John Flint.

### College of Mines in France.

The law authorizing the purchase of the estate of Chante Grillet, near St. Etienne, as a school of mines, has been decreed by a royal ordinance; such an institution will be most beneficially felt in that great coal mining district.

### Harlem Railroad.

We understand that this company has made the contracts for the grading and masonry for the extension of the road to Dover, Dutchess county, 29 miles from its present terminus. The contracts are made with men of experience, able to go on with the work without delay, and complete it by the 1st day of July next. The whole cost, it is said, will be less than \$223,000, which is \$27,000 below the estimate of the engineer. The farmers of Dutchess county, alive to the importance of this work, have made a free gift of the right of way for nearly the entire distance. The cost of the right of way was estimated at \$25,000; it will not much exceed \$5,000. The engineer will immediately go on with the surveys, and locate the road from Dover to Chatham, 45 miles, where this road will unite with the Albany and Stockbridge road, 23 miles from the city of Albany; the surveys already made, and the routes marked out, offer very favorable lines and grades. It is said that the route proposed by the way of Pine Plains will materially shorten the line, and that it may be adopted. It is the intention of the company to have the grading of the road from Dover to Chatham under contract this year, and if practicable, have the whole line to Albany finished, and in operation to Albany, before the close of next year.

There appears to have been new energy and vigor infused into this company during the past year.—They have erected a new and spacious engine house at 33d street—and are now erecting a freight depot at 27th street—for the accommodation of the business sure to result from the extension of the road into the heart of old Dutchess.

### Increase of Business on the Public Works.

Many will be astonished, when they get the annual reports of the different public works this year, at the wonderful increase of the business of the year. The increase will be nearly, or quite, 20 per cent. greater than any previous year. The amount received for tolls on all the New York canals during the first week in September, was.....\$105,178 12 Same period in 1846.....81,481 15

Increase.....23,696 97

The aggregate amount received from tolls from the commencement of navigation to the 7th of September, inclusive, 130 days, was.....\$2,320,601 90 Same period in 1846, 145 days,....1,589,259 15

Increase.....731,342 75

The following table shows the amount received for tolls during the first week in September, from the years 1840 to 1847, inclusive; and also the aggregate amount received from the commencement of navigation to the 7th of September, inclusive, during the same years:

*New York State Canals.—Receipt of Tolls.*

Year.	1st week in Sept.	Total to Sept. 7th.
1840,	\$57,752 21	\$971,482 44
1841,	62,330 88	1,197,461 16
1842,	52,766 49	967,673 45
1843,	68,720 27	1,196,272 05
1844,	77,593 35	1,520,041 86
1845,	75,740 39	1,453,814 93
1846,	81,481 15	1,589,259 15
1847,	105,178 12	2,320,601 90

The increased tolls on the canals of the State of New York thus far this year, have been nearly 50 per cent. and on the public works of Pennsylvania about forty per cent.

*Public Works of Pennsylvania.—Income from Tolls.*

Receipts for August, 1847.....	\$191,739 11
Receipts for August, 1846.....	136,313 20

Increase August, 1847.....	55,425 91
Total amount of tolls received from December 1, 1846, to September, 1847.....	1,211,373 09
Same period previous year.....	847,201 58
Increase in 1847.....	364,171 51

The aggregate tolls this year will not fall much short of sixteen hundred thousand dollars, and the increase will not vary much from five hundred thousand dollars, compared with the total of last year.—This result will give renewed confidence to the people of the State, and induce them to push through, at the earliest period possible, the Central railroad.

*Springfield, Hartford and New Haven Road.*

The annual meeting of the stockholders of this company was held in Springfield on Wednesday. The Hon. Thomas K. Brace was called to the chair, and Hon. I. W. Stuart was appointed secretary. It appears from the report of the directors that the receipts of the company have been much greater the past than any previous year.

For passengers.....	\$177,133 00
For freight.....	90,681 32
Rents, storage, steamboats, expresses, mail and other sources.....	56,910 96
Total receipts.....	324,725 28
Deduct expenses and interest.....	167,251 46

Balance.....	157,473 82
Cash on hand September 1, 1847.....	65,824 44

The amount received for passengers in 1846, was \$155,061 01—increase in 1847, \$22,071 99, or 14 1-5 per cent.

The amount received for freight in 1846, was \$61,250 73—increase in 1847, \$29,430 69, or 46 1-3 per cent.

The number of persons transported between all the stations on the road the past year, is \$226,595—the previous year, 191,270—showing an increase of 35,325. No accident of any serious character has occurred in the transportation of the passengers.

The expenses of the year have necessarily been large. In addition to the re-building of the bridge over Connecticut river, all the important bridges between Hartford and New Haven have been re-built in the most complete and substantial manner. Two new locomotives have recently been ordered; and during the year two passenger cars, two second-class cars, and 34 eight-wheeled freight cars, have been put upon the road.

The entire cost of the branch road to Connecticut

river, which was completed and put in operation at the opening of navigation in the Spring, is \$85,607 64. The business on it is large, and has fully justified the anticipations which led to its construction.

The relaying of the track between Hartford and New Haven with a heavy rail weighing 57 lbs. to the yard, was completed in the month of June, with the exception of three miles.

The directors have made a dividend of four per cent., payable on the 1st of October.

The following gentlemen were re-chosen directors for the ensuing year, viz:

Charles F. Pond, David Watkinson, Hartford; Elisha Peck, C. Vanderbilt, New York; Ezra C. Reed, New Haven, J. S. Brooks, Meriden; F. R. Griffin, Guilford; C. W. Chapin, William Dwight, Springfield.

The directors have re-elected Charles F. Pond president, James H. Wells treasurer, and Horatio Fitch secretary.

The increase of business on this road has exceeded even our expectations. It shows that we may rely confidently on a large increase in the various departments of traffic—especially of freight—which on this road exceeds, by over 46 per cent., that of last year. It may not another year show as rapid an increase—as there may not be both famine and war to stimulate trade next year—yet the increase will be constant, and the people will see that judicious investments in railroad stocks are among the very best that can be made; for the reason that their income will increase, and the cost of working them will decrease, from year to year.

*Mississippi and Atlantic Railroad.*

*Boston Enterprise. Western Trade. Indianapolis Convention. Railway to take the course of the Cumberland Road. Connection with Cincinnati—with Baltimore—with Boston. Immense and increased value of Western Trade. Importance of this Railroad to Commerce, and to Value of Massachusetts Railroads.*

We find in the Boston Courier, of 9th inst., the following article, showing conclusively that efforts are being made to unite the Boston and western interests. Indeed, even a casual observer must have observed, for years past, that the business men of Boston have been devising, and carrying out their plans to draw, as far as possible, the return business to themselves—and they will do it, too, to an astonishing extent, unless the other cities open greater facilities for rapid and cheap communication between their own ports and the granaries of the west.

We are not quite sure, but we conclude the article was written by some gentleman residing on the line west of Columbus, Ohio. He says:

"Boston is behind no other city in promoting the great improvements of the age; and her enterprize already overleaps the bounds of New England, and extends a helping hand to develop the latent energies of the remoter portions of our wide spread nation.

"The trade of the west, if placed in connection with the Atlantic States by continuous railroads, would greatly exceed in value the whole existing commerce of the United States with foreign nations; and it is somewhat remarkable that no combination of wealth and enterprize has hitherto projected and accomplished a scheme for a grand and unbroken railroad communication between the commercial cities of the Atlantic coast and the emporium of the Mississippi valley.

"In May last, a convention, at which the

present governor of Ohio presided, was held at Indianapolis, consisting of delegates from the three States of Ohio, Indiana and Illinois, to consult upon suitable means to effect a railroad connection between St. Louis and Cincinnati; and in conjunction with this object, a continued railroad connection between St. Louis, on the Mississippi, and the termination of the Baltimore and Ohio railroad at Wheeling, on the Ohio, with the ultimate view of thus completing a railroad communication, by one grand route, from the emporium of the upper Mississippi to the Atlantic border.

"The route proposed for this railway is the line of the great Cumberland road, as marked out under the direction of the engineer department, by authority of Congress. It runs from Wheeling, on the Ohio, through Columbus, the capital of Ohio, Indianapolis, the capital of Indiana, Terre Haute, on the Wabash, and thence in a direct line to St. Louis, on the Mississippi—taking, in its whole course, one of the most fertile regions of the west, with a population capable of insuring to the road a local business which would be alone sufficient to make it a safe and profitable investment.

"It intersects the Wabash and Erie canal at Terre Haute; the railroad from Madison, on the Ohio, to Indianapolis: the Cincinnati, Mad river and Sandusky railroad at Springfield, Ohio; and the great canals of that State, besides several railroads now in a state of progress or inception. The branch for Cincinnati will diverge from the main line at Richmond, which point is sixty miles only from that city, and lies upon the eastern border of Indiana.

"The whole distance from St. Louis to Wheeling is 600 miles, through districts remarkably favorable for the construction of the road. A company is already chartered to construct that portion of the road which passes through the State of Indiana, and the legislature of Ohio have granted the right of way for its entire course through that State to Wheeling. No further legislative action is therefore required to commence the prosecution of the whole line, with the exception only of that portion which extends through the State of Illinois, comprising one hundred and sixty miles.

"The wealth and enterprize of Indiana and of Ohio are fully adequate to accomplish their portion of the enterprize, and the city of St. Louis is ready to give a helping hand to that portion which passes through Illinois, where the population is not sufficiently dense or rich to accomplish the work without aid from abroad.

"The entire route, when completed, from St. Louis to Baltimore, will not exceed 950 miles in length, and may be readily travelled within 48 hours.

"Upon this route the whole travel from the eastern and middle States would inevitably concentrate. But the interest of the west invites her to a more direct route with the New England cities, which could be accomplished with readiness and certainty by a railroad diverging from the main stem at

Columbus, and striking the great Western railroad at Buffalo. A continuous line of railroad might thus be accomplished from Boston to St. Louis, by a direct and available route, every section of which would embrace a rich and well peopled country, abundantly able to sustain such a road, by the facilities afforded to its local trade and intercourse.

"The waters alone of the great valley of the Mississippi bear annually upon their bosom a commerce which was estimated, in 1845, at three hundred millions of dollars. This trade will double in less than ten years. The natural and best market for this immense commerce, is New England; yet there is at this time, no safe and direct means of commercial intercourse with any portion of the west; and during several months in the year it is wholly interdicted by drought, or flood, or frost. Could any investment more safe, or that promises a better return be hoped for than is offered by an enterprise to unite the capital of New England with the emporium of the west by a railroad which is already half accomplished, and which may be completed by a less amount of capital than has been profitably expended on 200 miles of railroad in Massachusetts and the middle States.

"It is well known that other routes for railroad communication with the west are proposed. *They will all ultimately succeed!*—But the strongest route will be taken first. Let intelligent men decide upon the comparative merits of those which have been urged upon public attention.

"Bring the immense trade of the west directly into New England by well constructed railroads, and the enterprise will not only afford, in itself, one of the safest and best investments ever offered to capital, but it will add from 25 to 50 per cent. to the value of every existing railroad in Massachusetts.

"The public are much indebted to Dr. J. S. Bobbs, and Hon. E. M. Huntington, of Indiana, and to Gov. Bebb, of Ohio, for their intelligent and persevering efforts to promote this great enterprise. Success cannot fail to reward them."

#### Railroad from Cincinnati to St. Louis.

We find the following account of the proceedings of a meeting of the people of Cincinnati on the 11th of August, in a late Cincinnati paper. It shows that Cincinnati is resolved to be, at least, connected with the great line westward to St. Louis—if not on the main line. The editor says: "the adjourned meeting of the citizens of Cincinnati friendly to the early construction of a railroad from Cincinnati to St. Louis, making Indianapolis and Terre Haute, in Indiana, points on the line, took place in the hall of the Merchants' Exchange, on Tuesday evening, August 11th, and was largely attended.

"James Hall, Esq., chairman of the committee appointed at the previous meeting to prepare resolutions for the consideration of the adjourned meeting, made the following report:—

Resolved, That we have heard with much gratification of the project of a railroad from St. Louis to Cincinnati, and heartily concur in the opinion, that a road would be of inestimable value, not only to those cities, and the intermediate country, but to the travelling and

commercial community of the nation at large.

Resolved, That the vast amount of travelling and business passing daily and hourly between St. Louis and Cincinnati, the circuitous route of the communication by water, and its frequent obstruction by ice and low water, render the construction of a railroad between those points, not only necessary, but indispensable.

Resolved, That as a part of the great line of travel, between the sea ports of the Atlantic, and the producing regions of the west, the connection between St. Louis and Cincinnati is necessary and inevitable; and equally so, whether the remainder of the route be through Pittsburgh to Philadelphia, through Western Virginia to Baltimore, or through Kentucky, Tennessee and Georgia to Charleston.

Resolved, That the facilities which would be offered by such a road, for conveying the produce of the country lying along its route, to market, and especially to the great markets of Cincinnati and St. Louis, would in a few years more than repay the cost of its construction, in the value it would add to land and other property, even if it should yield no profit as a stock; but we believe that as an investment it would be one of the most profitable railroads in the United States.

Resolved, That considering the importance of this road to Cincinnati, we hold it to be incumbent on the citizens and city council, to extend to it, without delay, and in the most substantial form, their decided support, and we earnestly commend to them in this respect the public spirited and sagacious example of the city of St. Louis.

Resolved, That we respectfully and earnestly recommend to the city council of Cincinnati, that having first obtained the necessary authority, they subscribe on the part of the city for a liberal amount of the stock of the said road, of which one hundred thousand dollars shall be subscribed to the road from Cincinnati to Hamilton, in Ohio.

Resolved, That we further recommend to the city council, that they extend towards the contemplated road their sanction and approbation, by the appointment of a committee from their body to collect information in regard to the route, length, cost, advantages, and all other details and circumstances connected with said road, to correspond with other committees and bodies, who may have charge of the same subject in other places, and to report to the council from time to time all the information they may collect in regard to it, so that the said council, and all our citizens who may desire to patronize this magnificent national work, may have access to authentic facts in relation thereto.

Resolved, That the president and secretary of this meeting communicate these resolutions to the city council, and also cause them to be published in the city newspapers.

The meeting was addressed by Judge Huntington, of Indiana, Judge Hall, Rufus King, Esq., and others of Cincinnati. The remarks of Judge Huntington with reference to the easy practicability of the scheme, the great fertility of the country which the proposed

line would open to the leading exchanging and shipping points of the west, the assurances that have been given of large subscriptions in the counties that would be passed through, and the great importance of moving early—*promptly*—now—in an effort to connect St. Louis and Cincinnati by an iron track such as that which is proposed, were extremely interesting, and listened to with great attention.

The resolutions were passed unanimously, and ordered to be published; after which the meeting adjourned.

R. BUCHANAN, Chairman.

W. D. GALLAGHER, Secretary.

#### Boston & Maine Railroad—Annual Report.

We have received a copy of the annual report of the directors of this company to the stockholders.—It shows a very favorable state of its affairs. The increase in its business, during the three months ending with August, over the corresponding period of last year, was over \$55,000; exhibiting a state of prosperity highly gratifying to those interested. The directors say—

Since the last annual meeting of the stockholders, the railroad has continued in successful operation. The receipts from transportation of passengers and freight have continued to increase; and its prospects for the future are every way encouraging.

The Medford branch railroad, extending from the main track east of the Mystic river to the centre of the village of Medford, has been completed; and the trains of cars have passed over the road regularly since March 1st, 1847.

Arrangements for the use of the Portland, Saco and Portsmouth railroad by this company, in connection with the Eastern railroad company, have been carried into effect; to the great convenience of the travel between the State of Maine and Boston, and the intermediate towns between Boston and Portland on our own road and other railroads intersecting ours. This has given to the stock of the Portland, Saco and Portsmouth railroad an increased value, while it secures to the Boston and Maine, and Eastern railroads a terminus in the city of Portland advantageous to both these companies.

To secure the advantages to this road of the business that would probably be created by the extensive outlay of capital contemplated by the Essex company, on the banks of the Merrimac river in Andover and Methuen, as well also to provide the most direct railroad route from Manchester, N. H., to this city, should the legislature of New Hampshire grant a charter for a railroad from Manchester to Methuen, the president of this company in January, 1846, presented a petition to the legislature of this commonwealth, asking authority to change its line of railroad in Andover, and also to construct a branch railroad to Methuen, crossing the Merrimac river by a bridge. This petition was referred to the committee on railroads and canals, and at the meeting appointed by the committee for a hearing, the object of the petition was explained; but the committee refused to proceed, as the authority to petition did not emanate from a vote of the stockholders.

A meeting of the stockholders was immediately called, and held at Andover on the 7th of February, 1846, to determine if they would sanction this petition to the legislature. At this meeting, as it will be remembered by stockholders, there was a strong opposition to the change of location; and it was argued that a branch railroad, of a mile and a half in length, extending from the main track at North Andover, would give all the facilities necessary for the companies established at what is now the town of Lawrence. To meet this opposition, the expediency of obtaining the grant was suggested as a precautionary measure, as some other parties might avail themselves of the valley of the Shawshine as a route for a railroad, to the great injury of this company. It was further argued that that part of the road from North Andover to Andover Bridge could be built immediately, and the residue through the valley of the Shawshine river, together with the bridge over the Merrimac river and Branch road to Methuen, be delayed until the Manchester and Methuen railroad should be chartered or commenced.

After this explanation, the stockholders passed the following vote:—"Voted, unanimously, that the stockholders approve and sanction the petition of the president of the company to the legislature of the commonwealth for the change of the location of the railroad in the town of Andover, and of the application for a charter to construct a branch railroad to the town of Methuen, in behalf of the corporation; as also to obtain permission to increase the capital stock by an amount not exceeding five hundred thousand dollars." The act applied for was granted by the legislature, and that part of the road between N. Andover and Andover bridge was built and opened for use in the spring of this year, with extensive side tracks sufficient for the delivery of all the materials sent there by railroad.

Still the companies who had commenced the work on the Methuen side of the river were subjected to the expense of a toll bridge in teaming their materials from the railroad to their works. The directors, aware of the expense and inconvenience to the various parties on the west side of the river, and having a strong faith that the Manchester and Methuen railroad would be chartered, determined to build the bridge over the Merrimac river; and to hasten the work, contracts were immediately made, that the stone piers might be built at the low stage of the river in the summer of 1846. This was done, and the contracts for the superstructure made, to be delivered as soon as practicable in the fall of the year; so that, at any rate, it could be put on early in the spring of the year 1847.—Most of the timber was delivered; but the contractors failed to deliver a portion of it, which was of extra dimensions, and difficult to be procured. From this cause the completion of the bridge has been delayed; but it is now nearly framed, and will, with all despatch, be finished.

The charter of the Manchester and Methuen railroad, which is to connect with this road at the line of New Hampshire, was

granted at the last session of the legislature of that State. The company has been organized, the stock taken, and it will no doubt be completed and open for use during the next year; when, in connection with other railroads extending into the northern and western section of our country, it must operate favorably upon the interests of this company.

The grading and masonry of that part of the change of the location of the road which runs from Andover bridge through Ballardvale to our present road at the Thompson curve in South Andover, was let to contractors highly recommended for their competency to perform their engagements. But the contractors for the grading have failed to expedite the work so energetically as they should have done; and from this cause, and the large excess of rock cutting over and above what was expected by the engineers as well as contractors, the road bed will not be completed before winter sets in. In referring thus minutely to the change of the location of the road, it is designed to meet a mistaken impression that this work has not been commenced as early as was expected by the stockholders.

We have now building and nearly completed, on our island in Charles river, an engine house and machine shop of extensive dimensions, calculated to meet the increased business of the road. Large additions have been made during the past year, and are continuing to be made, of motive power and working furniture; and preparations are making for laying a double track as far as Reading, which is designed to be continued to Lawrence.

The loss of five hundred tons of rail shipped from Wales, on board the ship *Trial*, which foundered at sea, has occasioned some delay in our improvements; but the company has sustained no important loss, as the cargo was fully insured. We have contracts for two thousand tons of rails in England, a part of which we shall soon be receiving.

THOS. WEST, President.

#### TREASURER'S REPORT.

The treasurer submits to the stockholders the following statement of the financial affairs of the corporation:

The amount of capital stock paid in on September 1, 1847, was.....	\$2,596,154 02
The amount of debt, exclusive of unliquidated claims, was as follows:	
State loan, not now payable.....	\$150,000 00
Bonds.....	41,000 00
Notes payable, after deducting cash on hand and at interest.....	19,858 13
Amount expended on the Massachusetts portion of the road, to September 1st, 1847.....	210,858 13
Main road.....	\$1,593,648 61
Change of location at Lawrence.....	110,779 52
Medford branch.....	51,151 01
Amount expended on the New Hampshire portion of the road.....	1,755,589 17
Amount expended in Maine.....	804,455 49
Locomotives and cars.....	\$2,626,101 71
Total expended on road and equipment.....	182,627 80
	\$2,808,729 51

Receipts and expenses for the financial year ending May 31, 1847, when the accounts of the corporation are made up.

#### RECEIPTS.

Reserved profits, June 1, 1846.....	\$22,972 51
Passenger fares.....	264,863 39
Freight.....	144,139 06
Mail.....	5,235 01
Rents.....	548 87
	\$437,758 84

#### EXPENDITURES.

Repairs of engines and cars.....	\$31,096 00
Repairs of road.....	20,104 21
Repairs of depots.....	1,867 90
Repairs of bridges.....	174 50
Wood.....	31,593 31
Wood and water.....	8,262 90
Oil.....	7,772 59
General expenses.....	14,611 66
Clearing snow.....	9 33
Care of bridges.....	993 31
Merchandise expenses.....	13,794 85
Portland, Saco & Ports. R.R.....	19,166 66
Of conductors and brakemen.....	8,923 41
Enginemen and firemen.....	12,794 74
Depots and offices.....	10,505 89
Interest.....	16,461 83
State tax of N.H. & other taxes.....	6,608 39
	\$204,744 51

Profits.....	\$233,014 30
Dividend of \$3 50 per share, paid January, 1, 1847.....	\$83,310 50
Dividend of \$4 pr share, paid July 1, 1847.....	95,212 00
	178,522 50
	\$54,491 80

On the 19th of December last, the directors ordered the sum of 20,000 dollars to be charged to profit and loss, on the ground of the depreciation of the engines and cars below their cost.....

Leaving as reserved profits.....	\$34,491 80
----------------------------------	-------------

The following is a statement of the earnings of the road since June 1, 1847, as compared with those of the preceding year.

	1846.	1847.
Earnings in June.....	\$29,777 61	\$40,306 05
" July.....	36,616 50	62,036 87
" August.....	34,331 82	63,679 89
	\$100,725 93	\$156,022 81

All which is respectfully submitted,  
EDW. PICKERING,  
Treasurer Boston and Maine Railroad.  
Boston, September 1, 1847.

#### Railway Brakes.

We shall let no opportunity escape us of calling attention to this subject, and of placing before our readers the opinions and plans of practical men in relation to it; we therefore copy from the *London Mining Journal*, of 14th August, the plan of George Stevenson, Esq., as explained by him at a meeting of the Institution of Mechanical Engineers.

At a quarterly meeting of the Institution of Mechanical Engineers, held at the Philosophical Institute, Birmingham, on Friday, 6th inst., J. G. McConnell, Esq., of the North Western railway, in the chair, the following communication from Mr. George Stevenson was read:

"The various accidents on railways arising from concussions and collisions (and especially the late accident at Wolverton) have induced me to draw my attention to the construction of a self-acting railway brake, which I have for several years had in view—a plan and model of which I have had made, and now lay before the society, with my descrip-

tion of its action and effects. When a railway train is moving at the rate of from 40 to 50 miles an hour, the momentum is so great that it cannot be stopped in any reasonable distance by the brakes at present in use; or if an axle tree break, or any accident happen to the engine, so as to prevent its progressing, the sudden shake causes the carriages to overrun each other, and those next the engine are almost certain to be crushed. In an accident of this kind neither the engine driver, stoker, or guard can be prepared; and before there is time for any of them to put on the brake at present in use, so as to be in the least degree effective, the collision or concussion has taken place. When the engine driver shuts off the steam, or applies his brake on the tender, the self-acting brake is immediately brought to bear upon every wheel attached to every carriage in the train so powerfully, if necessary, as to bring every wheel into the condition of a sledge. I think the train will be brought to a stand by this brake in 1-10th of the space in which it can be by the brakes at present used.

"My plan is as follows: I attach a couple of spiral springs to the levers of the brake of every carriage, and also connect them with the buffers; and if the carriage requires gentle breaking (which will always be the case when a train approaches a station,) the engine driver, by shutting off a portion of the steam, or applying the brake gently, will have complete command over the train, without any of those violent uneasy motions which are very frequent, and excessively disagreeable to passengers; and as the guard is frequently compelled to apply his brake so powerfully as to make the wheels slide on the rail, and cause a considerable amount of wear and tear on the tire of the wheel, by which it becomes flat sided, and makes the carriage uneasy, and creates a jumping motion on the rail. Suppose a train of carriages moving at the rate of from 30 to 40 miles an hour, and a signal is held out for the engine driver to stop, the moment he shuts off the steam, the whole of the brakes are brought into instant application of sledging the wheels, which will be more effectual than 50 men applying the common brakes, as the mischief is frequently done before the guard can be apprized of the approach of danger.

"It is frequently necessary for the trains to be backed into a siding; when this is required, the train will first have to be stopped, and in one minute the whole of the brakes can be disengaged from the buffers, as is shown in the model, and when the train proceeds they are again dropped into gear.

"The plan altogether appears so simple, that any ordinary mind can easily understand the whole of it, and I think the cost of putting the brakes on each carriage would not exceed more than from £5 to £10.

"Any effectual plan for increasing the safety of railway travelling is, in my mind, of such vital importance, that I prefer laying my schemes open to the world, to taking out a patent for it; and it will be a source of the greatest pleasure to me to know that it has been the means of saving even one human

life from destruction, or that it has prevented one serious concussion."

In consequence of Mr. Stevenson's absence the invention (of which a beautiful model was exhibited) was not discussed, it being agreed that a special meeting should be called to consider the subject.

The consideration of Mr. Buckle's experiments on fan blasts (see Mining Journal of 22d May) now exciting considerable interest, was then resumed. The chief object of Mr. Buckle was to show that the present fan blasts were imperfect in construction and expensive in operation. He proposed, as the result of experiments extending over a period of nine years, to have a series of fans, revolving in such a way as that the blast of air thrown from one would be communicated to each. He also showed the advantages of having a large inlet pipe; by these means he estimated that not only would the blast be stronger with less horse power, but it would also be uniform—thus improving the quality of the iron, as well as producing it at a cheaper rate.

Several of the members took part in a discussion which arose on a purely theoretical question, as to the laws by which air was regulated; and at the close, a vote of thanks was given to Mr. Buckle.

Papers on various engineering subjects were then promised by several of the members, and the meeting adjourned.

#### THE COMMERCE OF NEW ORLEANS AND OF THE ERIE CANAL.

The Albany Argus has a statement of the commerce of New Orleans for the year ending 31st August, which enables us to compare the movement from the interior to that city, of some of the principal articles of breadstuffs, with the movements of the same articles to tide water upon our State canals. This statement will serve to disabuse the minds of many who entertain the idea that in this branch of our commerce, New Orleans far exceeds that of our canals. Indeed, we have heard it said by those who no doubt had perfect belief in the truth of their statements, "that it was no uncommon thing to see 500,000 bushels of corn afloat in New Orleans, the result of one day's receipts from the interior." That the commerce of New Orleans, in the article of breadstuffs, has rapidly increased within the last twelve months, under the active demand for Europe, no one will doubt; but it will not be found to show a greater increase than that of our State canals.

In the first place we will present the receipts at New Orleans from 1st September, 1846, to 1st September, 1847, of flour, wheat and corn, and of the same articles delivered from the Erie canal at tide water, from 1st May, 1847, to 1st September, 1847, a period of only four months.

	Erie canal.	New Orleans.
Flour,	2,392,508 bbls.	1,617,675 bbls.
Wheat,	2,533,589 bush.	1,670,000 bush.
Corn,	4,504,985 "	7,065,000 "

Here we find, in the space of four months, the receipts of flour are greater by 750,000 barrels, and of wheat by 850,000 bush. than

the receipts at New Orleans for the whole of the year. The article of corn is less by 2,500,000 bushels.

We will now present the statement of the articles of flour, wheat and corn, delivered from the Erie canal at tide water, from the 1st September, 1846, to the 1st September, 1847, embracing the entire canal season for one year, and with it the statement of the same articles received at New Orleans during the same period.

	Erie canal.	New Orleans.
Flour,	3,858,300 bbls.	1,617,675 bbls.
Wheat,	4,599,272 bush.	1,670,000 bush.
Corn,	5,083,318 "	7,065,000 "

We have here the business of one year at the two points, although that of the Erie canal embraces a period of but seven months: still it is the entire season. The difference in the receipts at the two points in the articles of flour and wheat is very great; and the excess of corn received at New Orleans over the quantity from the Erie canal is also very large. The increase however in the receipts of corn from the Erie canal has been greater than at New Orleans, having risen to the enormous quantity of 5,000,000 bushels in one year, the previous seasons sending forth merely a nominal amount, seldom exceeding 300,000 or 400,000 bushels; while at New Orleans, the receipts as far back as 1837 and 1838, have not fallen much below 450,000 bushels in any one season.

These are facts showing the success of our canal commerce in the single article of breadstuffs laboring as it does under an ice embargo for a period of nearly one half the year. Still that commerce increases yearly, and future seasons will show the ability of our system to maintain a successful rivalry with New Orleans for the treasures of the fertile west.

#### Anthracite Coal for Locomotives.

We find in the Journal of the Franklin Institute for August last, the following article, by Professor W. R. JOHNSON. The growing importance of the subject, and the reputation of the writer, will ensure an attentive perusal of his views in relation to it; and we therefore give it entire.

At the monthly meeting of the Franklin Institute, held June 17th, 1847, the following remarks on the use of anthracite in locomotives, were made by PROFESSOR W. R. JOHNSON.

Since the attainment of so complete a success, in using anthracite under the boilers of stationary engines, and on board of all our principal river and sound steam vessels on the Atlantic coast, it has become a subject of much inquiry, to determine why so little success has attended the efforts to introduce it into general use upon railroads. Various trials, on the Columbia road, and others on the Reading road, have, it is understood, been attended with so little promise of advantage, as to cause, at present, the abandonment of that fuel, and an adherence to wood, as the only available material. The cost of wood, alone, to the Reading railroad, during the last year, is put down, in the late annual report, at \$202,061, and, as the total quantity of coal brought to market over the road, was 1,188,258 gross tons, we have, after deduct-

ing the wood required for passenger and freight trains, an expense of \$191,569, for the wood required to haul that quantity of coal 94 miles, and to take back the empty cars. It is true, that the whole of this coal did not reach tide water, but the computation is based upon the fact, stated in the report of the company, that the cost of wood, "per round trip of 188 miles," to haul 360 tons of coal, the above distance, and "back with empty cars," was 14.92 cords, costing \$58.04. It is estimated, by the president of the railroad company, that the introduction of anthracite, instead of wood, would save the company \$125,000 per annum. Should it save half this sum, it is evident that great outlays, to effect the purpose, would be warranted, and, consequently, the efforts heretofore made would be fully justified. Mr. Nicolls, the engineer, and general superintendent of the Reading road, has been, for some time, engaged in an effort to accomplish this object, by placing the engine and boiler on separate carriages, with a view to an enlargement of the fire surface of the latter. Mr. N. has, in fact, used an ordinary locomotive, to which he has attached, on a separate truck, a boiler 16 feet long, and 4½ feet wide, with a semi-cylindrical arch running the whole length. This is connected by jointed pipes, with the engine. The blast is created by a fan, driven by a small engine. The escape steam is thrown into what was the original boiler of the locomotive engine, which is still retained, for the double purpose of serving as a condenser, and of making weight on the driving wheels. If this plan of condensation shall be found available, much time will be saved which is now consumed at water stations, as a large portion of the water will be constantly circulating.

So important to the Reading railroad, has this item of expenditure of fuel become, that, during the past year, efforts have been made by the company to manufacture an artificial fuel, with a basis of anthracite, as a substitute for wood. In this, they are understood to have so far succeeded, as to have made some trips with it. But still the desideratum is the use of anthracite alone.

Having several times, within seven or eight years, witnessed the exclusive use of anthracite, in all the locomotives on the Beaver Meadow and Hazleton railroads, making round trips of thirty or forty miles, I have felt much interest in tracing the causes of ill success elsewhere.

From all the inquiries which I have been able to make, the following appear to be regarded as the chief impediments to the use of anthracite in locomotives.

1. The want of rapid ignition, and free, lively combustion.

2. The intense, concentrated, local heat, which is said to destroy the grate bars, to attack the rivets and laps of the fire box, and even to cause blisters to rise in the plates of which it is composed; and, finally, to fuse the ashes into a troublesome clinker.

3. The sharp, angular particles of coal, projected by the violent, fitful blast of the escape steam, obliquely into the ends of cop-

per tubes, cuts them away within a few inches of the fire end. In the upper range of tubes, it is the upper side which is chiefly attacked, and, as might be anticipated, in the lower ranges, the lower sides are most worn away. The effect of this cutting is usually limited to four or six inches of the length of the tubes.

4. The difficulty of fitting in iron tubes, so as to make perfect joints, and, at the same time, avoid irregularity in the form of the heads, and loosening one tube while another is fastened.

As the first of the above difficulties, the want of proper activity in the fire, has been completely overcome in our steamboats, by the use of a steady fan blast, it seems that an equivalent blast in the locomotive ought to produce the same effect. The irregular, fitful current, generated by the waste steam, is not in all respects equivalent to the blast of a fan, but when that blast is equalized, by projecting the escape steam, first into a receptacle of considerable magnitude, and then through a number of small pipes, equally distributed over the area of the chimney, the blast is so nearly equable, as to answer completely the purpose of sustaining the fire in brisk and uniform activity. This method of disposing of the escaping steam, originally invented by Mr. Gurney, and applied in common road engines, to prevent the frightening of horses, by the sudden, violent belching sound, was first introduced here by Mr. Hopkins Thomas, now of Beaver Meadow, while a workman in the employ of Messrs. Eastwick & Harrison. His object was a steady blast, not the mere avoidance of disagreeable noise.

The steam box used to equalize the draught, is cylindrical, 12 inches in diameter, and 11 inches deep; two tubes, each three inches in diameter, flanged at the opposite ends to the steam chests of the two cylinders of the locomotive, support the box in the interior of the dust chamber, and convey the escape steam to its centre. A lid, ground to fit the top of the steam box, has 18 jet pipes, rising two or three inches from its upper surface, drawn in at the top to a diameter of half an inch. These are placed just beneath the base of the chimney, and their purpose is to distribute the escaping steam throughout the chimney, and, by limiting, to some extent, the rapidity of flow, to maintain within the box a pressure approaching to uniformity.

Messrs. Eastwick & Harrison founded, on a division of the receptacle, into two parts, a patent, which they applied in some engines built by themselves. But as this evidently tended to make the action of the steam upon the air of the chimney, in a degree partial and fitful again, the Beaver Meadow and Hazleton companies discarded this modification of Gurney's plan, and, in all their engines, which have constantly used anthracite for the last eight or nine years, the draught is ample, the combustion regular, and the evaporation vigorous and well sustained. The fire is, of course, kindled with wood, and when this is well ignited, anthracite is added by little at a time, usually not more than a single shovel full, and in lumps, com-

monly not above six inches in diameter. If larger than this, they would remain too long in mass, dark and ineffectual; if small egg or nut coal alone were used, it would, it is alleged, by the jarring of the locomotive, spread over the whole fire at once, and check the evaporation. While under way, the bed of coal under the grate is kept at a thickness of five, or at most, six inches. When fresh coal is added, care is taken, that a single shovel full only is put on at once, and that this is thrown on the part which appears thinnest. Much experience in watching the indications of a manometre, while generating steam by anthracite, enables me fully to appreciate the importance of these practical precautions. In some of the attempts to use anthracite on the Reading railroad, a bed of 18 inches thick is said to have been allowed to accumulate on the grate. In such cases, the whole engine is said to have become excessively overheated, and a flame to have passed out at the chimney. This is easily understood, when we consider that, in passing through so thick a mass of hot coal, the carbonic acid at first formed ( $\text{CO}_2$ ) by taking up a second proportional of carbon, becomes  $\text{CO} + \text{CO}$ , or two proportionals of carbonic oxide. The atmospheric air to ignite this compound, gains admittance partly through the chinks of the fire door, and the dust box door, and is partly found near the chimney top, where the intermitting blast through a single jet pipe, keeps the chimney alternately receiving and emitting air.

The second evil, that resulting from the highly concentrated heat, has been found much more serious than the preceding. Grate bars were burned out in a few weeks. Capt. A. H. Vancleve, who had charge of the Beaver Meadow road, states that, at one period, wrought iron bars were substituted for cast, but that it required two smiths' fires to be in constant employ, to make grate bars for four locomotive engines. The secret of preventing this occurrence, was stated by a gentleman at Hazleton, to have been discovered by accident. A boulder, which had rolled from a slope upon the track of the railroad, tore off the ash box of the first engine which passed. As the damage did not interfere with the running of the engine, and as it was not convenient for some days to return to the machine shop, it was permitted to continue its trips for some days, without an ash box. The overheating and wasting of grate bars were so manifestly obviated during the time, as to attract immediate attention. Ash boxes were successively removed from other engines, and, from the adoption of this alteration to the present time, the destruction of grate bars has ceased to be a source of serious inconvenience. A set in the locomotive Franklin, were put in in June, 1846, and were in use, and in good order, at the end of May, 1847.

It may be supposed that the wooden superstructure of the road, and particularly that of bridges, would be endangered by the constant falling of sparks. In the main, it may be said, that this evil at length cures itself, for both road and bridges, except the rails

become covered with a stratum of cinder and fine particles of coal, which effectually defends all beneath from danger of igniting by particles of hot matter from the grate. Unlike particles of ignited charcoal, these are, from their very weight, not liable to be easily raised and blown about by the currents of air created by the cars, which pass over them after they reach the road. Hence the only precaution which has been found necessary, is to place two sheets of iron, one on each side of the bottom of the fire box, extending downwards about nine inches, and sloping inwards, to confine the falling cinders to the central part of the track. At first a watch was established at the bridges, but when the roadway became covered with cinder, there was found to be very little danger from this source. The Hazleton and Beaver Meadow roads have wooden rails, laid with flat iron bars; where edge or T rails are used, the danger would be manifestly less than in the case of these roads, which have so long used anthracite without detriment.

The concentrated heat of anthracite fires, generally affects injuriously only the laps and rivets of the fire box, unless the iron of that part of the boiler be of inferior quality. Hence the importance of selecting the very best of iron for the fire box, and the probable utility, as suggested by Capt. Vancleve, of subjecting it to a high temperature before using any plate for this purpose, in order to detect blisters or imperfect weldings, if such exist in the interior. The number of pieces used in the lower part of a fire box, ought to be the least possible, and the horizontal laps ought not to have their edges presented downwards to the action of the rising flame. I see no practical difficulty in the way of rolling sheets 18 inches wide, long enough to form the entire circuit of the lower part of a fire box. Above that height there would be no danger from this peculiar action of the fire. Nor do I know of any serious objection to welding together the ends of such a sheet, especially if made three-eighths of an inch, or more, in thickness, and thus forming a band in which not a single joint or rivet should come in contact with the fire. All other parts of the boiler would still be made in the ordinary manner.

The locomotive Lehigh commenced running on the Hazleton road in 1838. In 1448 it was found necessary to renew a space of about 18 inches in the lower part of the fire box, and this is the only repair which that part has undergone since the engine was put upon the road. I examined it in the latter part of May, 1847, and found the iron, to all appearance, sound and good, with no leak at the rivets, or elsewhere. Three or four of the upper rows of tubes in this engine have been in use since 1839, and the rest were renewed about two years ago.

To avoid the conversion of ashes into clinker, those anthracites should be selected, which are free from slaty plies, and which contain the least of sulphuret of iron, or other fusible impurities. Should any inconvenience be found from clinker on a prolonged trip, it could easily be removed at a watering

station, by means of a forked fire hook, adapted to that peculiar service. A small supply of wood may be carried for re-kindling, in case of unusual delays. But the experienced fireman will always be careful to clear coal and clinker from his grate, before he attempts a renewal with wood.\* Grates may be hinged, with a view to the prompt discharge of their contents, and, with that facility, the re-kindling with wood may take place even without stopping the engine, especially if advantage be taken of a favorable grade of the road.

The third point of difficulty, that resulting from the cutting away of copper tubes, is fully obviated by the substitution of iron, with the farther advantage of economy in the first cost. But this brings us to the fourth and last difficulty—that of securing iron tubes to the heads of the boiler.

This has been attempted in several different ways. One consists in cutting a screw at each end of the tube, to enter corresponding threads cut in the heads of the boiler, and then rivetting over the projecting edges of the tubes. That on which Mr. Baldwin has founded a patent, consists in brazing a short piece of copper tube to each end of the iron one, and then connecting the former with the head of the boiler, in the same manner as he puts in copper tubes. But that which seems the most simple, and which is quite effectual, as proved at Beaver Meadow and Hazleton, for a course of years, is the turning off of the iron tubes, on the outside, at each end, in the form of the frustrum of a cone, to the distance of seven-tenths of an inch, by which the thickness of the tube at the extremity is reduced about one-half. This conical part receives a ring of copper, cylindrical within, conical without, and about half an inch wide, which, after the iron tube has been inserted in its place, is driven on to its conical termination, filling the space between it and the edge of the aperture in the head of the boiler. This copper ring, by its wedging effect, tightens the iron tube, forms a close joint, and allows the edge of the iron tube to be slightly opened out, and rivetted, to form a very perfect juncture. The language used in describing the result of this mode of fitting in the tubes, was, that the "joints never leaked a drop." In rare instances, the welding of a tube, (made by the same process as gas tubes,) is found slightly defective, but this does not long put a stop to the use of the engine, for a very little labor suffices to tap a screw in each end, and plug up a single defective tube, till a convenient opportunity occurs for its removal. To clear dust of anthracite from the tubes, a species of screw auger, with a sharp edge, like that of a chisel, is occasionally employed.

The quantity of anthracite commonly used in a round trip of 30 miles, on the Hazleton road, is from a ton to a ton and a half, hauling 35 to 40 cars, and conveying 100 to 120 tons of coal. The grades on this road are heavy,—60, 80, and 140 feet per mile,—all in the direction of the trade. The severest

\* This, and the succeeding precaution, are suggested by Capt. Vancleve.

labor is, consequently, encountered, in taking back the empty trains. In two experiments, conducted by Capt. Vancleve, over the Beaver Meadow road, reducing its grades by Pambour's formula, to the condition of a level, he found that the seven ton engine required 1½ pounds of anthracite per ton, per mile, of freight and cars hauled, and the 13 ton engine took but one pound for the same labor. The small engine was subject to slipping of its wheels, on the high grades, which, of course, impaired the efficiency of its fuel.

Those who are most familiar with this subject, attribute to the early, persevering, and well directed efforts of the Hon. Samuel D. Ingham, formerly president of the Beaver Meadow railroad company, much of the credit of urging on to final success, the experiments which have proved so important to the interests of that coal region.

NOTE C.

James L. Barton, Esq., of Buffalo, in his letters on lake commerce, to the chairman of the committee on commerce in the United States House of Representatives, under date of May 15, 1846, says, "The storms and tempests on the lakes (Eric, Huron, and Michigan) are as violent as on the Atlantic, and the dangers of navigating them is known and acknowledged by those who have tried both, to be equally as great, if not greater. The boisterous weather last fall was very destructive to lives and vessels, amounting to, as nearly as a careful account can make it, sixty lives lost, thirty-six vessels driven ashore, twenty of which became total wrecks; four foundered with entire loss of crews and cargoes, and producing a loss in the value of property of over two hundred thousand dollars. And it has suffered in losses, within the last five years, more than four hundred lives, and destruction and damage to steamboats, vessels, and cargoes, more than one million of

dollars. Ruinous and destructive as the want of safe harbors is to our commerce, the difficulties are vastly increased from the almost impassable condition of the flats in Lake St. Clair. Here steamboats and vessels are daily compelled, in all weather, to lie fast aground, and shift their passengers, cargoes, and luggage, into lighters; exposing life, health, and property, to great hazard, and then by extraordinary heaving and hauling, are enabled to get over. Indeed, so bad has this passage become, that one of the largest steamboats, after lying two or three days on these flats, everything taken from her into lighters, was unable, with the powerful aid of steam, and everything else she could bring into service, to pass over!"

NOTE D.—Tubular Statement of the Length and Cost of the Principal Railroads in the State of New York, Together with their Receipts, Expenses, Net Income, Number of Passengers, and Number of Miles run by trains in 1846, as Compiled from the Official Returns made to the Secretary of State, January 1, 1847.

The above railways are mostly single track, with plate rail, (with the exception of two short ones,) but an iron rail is now being laid on those east of Rochester, which will cost £2,500, or \$10,000 per mile.

Total length 369 miles. Total cost £2,306,982 or 9,227,928 dollars.

Average cost per mile, £6,252 or 25,008 dollars.

Average profits ten per cent. on the above railways, or 11 9-10ths per cent. on the railways from Schenectady to Niagara Fall.

Average cost per mile for running the trains 71 cents.

Average per cent. of receipts for expense, 384.

#### NOTE E.—Commerce of the Lakes.

The unprecedented increase of the commerce of the upper lakes, during the past twenty years, caused by the increase of population and opening of new

avenues of communication with the fertile west, has exceeded the most sanguine estimates, and points with unerring certainty to its continued progress.

The construction of the important canal around the Sault de St. Mary, a channel of one mile, thro' which must flow the vast mineral wealth of the Lake Superior region, will give additional value to the already great and increasing north western trade. The growth of the west is steadily and rapidly onward; and with this growth the commerce of the lakes, and the travel between the east and the west must keep pace. The following statements of the increase of the upper lake commerce can be relied upon, as they are made up at the custom houses, at the several parts of the entry, from undoubted authority.

The first sail craft upon Lake Erie was the sloop Detroit, of 70 tons, in 1796, and up to the declaration of war, in 1812, the total number of vessels of all descriptions afloat upon Lake Erie was twelve. The first year after the war (1816) the aggregate tonnage of sail craft upon the upper lakes was 2150, embracing about forty sail (two small schooners only, being over 100 tons burden.) The number of arrivals and departures at the port of Buffalo that season, amounted to only eighty—in 1818, when the first steamer was built, they reached 100. In 1846, the number of arrivals and departures at the same port was seven thousand seven hundred and fourteen, forming an aggregate of one million eight hundred and twenty-five thousand nine hundred and fourteen tons.

On the first of July, 1847, there were the following number and description of vessels owned and running on the lakes above Niagara Falls, as near as could be ascertained by the most careful and extensive research.

Number and names.	Aggregate tons.	Average tons.
81 steamers,	35,835	443
31 propellers,	10,295	332
63 brigs,	14,589	231
315 schooners,	47,738	152
490 total,	108,457	221

There was an increase of tonnage of about thirty-five per cent. in the last eighteen months. The total cost of the above vessels is estimated at six millions two hundred and forty thousand dollars, or one million five hundred and sixty thousand pounds—of which amount, over two millions of dollars, or fifty thousand pounds has been expended since January, 1846, in the construction of new vessels, and the repairing and enlarging old ones.

The following comparative statements of the exports from the upper lakes, will mark the rapid change that has taken place within a few years in the west.

Articles.	1835.	1845.	1846.
Flour, barrels,	86,333	717,466	1,280,897
Provisions, barrels,	6,563	68,100	99,398
Wheat, bushels,	98,071	1,354,990	3,611,234
Corn, "	14,579	33,069	1,179,689

In addition to the above, the following articles passed through the Welland canal to Lake Ontario, from the west, and from the Canadian ports on Lake Erie.

Articles.	1845.	1846.	To July 1, '47.
Flour, barrels,	207,555	273,284	211,897
Provisions, bbls.,	13,963	34,211	16,608
Wheat, bushels,	1,891,627	3,172,969	1,658,093
Corn, "	22,092	461,933	445,100
Boards, feet,	11,584,096	14,855,065	13,848,921

#### PORT OF CHICAGO, ILLINOIS.

	Wheat exported.	Flour exported.
1845,	956,860 bushels.	13,750 barrels.
1846,	1,159,592 "	23,045 "
Increase,	502,732 "	9,295 "

The flour already shipped up to the 31st of July, 1847, exceeds that for the whole year last season.

#### PORT OF MILWAUKIE, WISCONSIN.

	Wheat exported.	Flour exported.
1845,	95,500 bushels.	7,500 barrels.
1846,	213,448 "	15,756 "

The flourishing towns of Racine, Southport, and Little Fort, on the western shore of Lake Michigan, between Milwaukee and Chicago, will add their share towards swelling this immense amount of exports, and will compare favorably with Milwaukee, lying, as they do, directly in front of the best wheat-growing country in Wisconsin.

The arrivals and departures at this port, Milwaukee, for 1846, were:

	Arrived.	Departed.	Total.
Steamers,	352	348	700
Propellers,	111	109	220
Brigs,	95	94	189
Schooners,	837	835	1672
	1395	1386	2781

To show how rapidly the west is being settled and improved, we have only to note the change that has taken place in Wisconsin alone, in a few years.

In 1830 the population was	3,245
" 1836 "	11,686
" 1840 "	30,945
" 1842 "	46,678
" 1846 "	245,228
" 1847 in July estimated at	360,000

Up to 1840, Wisconsin imported their supplies of every kind, including provisions. In 1846 they fed themselves, supplied an army of over 100,000 new emigrants, and of their surplus remaining they exported through the lakes between three and four millions of dollars in value, mostly in agricultural products.

The lead and shot made in this State in 1846, and which principally sought a market, via the Mississippi, is known to have been very large.

NOTE F.—The Great Western Railway Passes through the Niagara, Gore, Brock, London, and Western Districts, and confers upon the Welland, Huron, and Talbot. The following Abstracts from the Assessment Roll show the improvements in these Districts for the year 1846.									
Name of district.	Popula- tion.	Acres of land culti- vated.	Houses.	Mills.			Cattle.		
				Grist.	Saw.	Mer- chant.	Cows.	Young cattle.	Amount of taxable pro- perty.

Huron.....	14,983	20,355	187	12	17	14	452	2,519	91,120
Talbot.....	15,693	50,134	1,419	24	82	37	2,984	1,500	221,166
Total.....	291,098	1,085,737	19,176	378	637	802	46,594	34,503	£3,565,186

## NOTE G.—Port of Hamilton.

The following table is obtained from the collector of customs for the port of Hamilton, and comprises a few of the principal articles of export, for the years 1845, 1846, and a part of the year 1847.

Articles.	Year 1845.	Year 1846.	Year 1847.
Flour, barrels.....	119,348	155,293	136,090
Pork, beef, & spirits, bbls.,	4,614	8,993	5,793
Butter and lard, kegs and barrels.....	271	688	991
Fish, barrels.....	560	657	22
Wheat, Indian corn, barley, and rye, bushels.....	5,693	13,583	981
Hewn timber, feet.....	224,500	151,000	94,123
Boards, feet.....	135,152	16,750	486,400
Staves, feet.....	314,000	111,137	99,500

## WELLAND CANAL.

Statement of some of the principal articles of property passed through the Welland canal during the season of 1845, 1846, and of 1847 from the commencement of navigation until the first of July.

Articles.	1845.	1846.	1847 to July 1.
Wheat, bushels....	1,891,637	3,172,969	1,658,093
Corn, ".....	22,092	461,933	445,000
Beef and pork, bbls.,	13,963	31,211	16,608
Flour, barrels.....	207,555	273,284	211,897
Ashes, ".....	3,062	4,677	1,141
Salt, ".....	219,723	237,811	51,391
Boards, feet.....	11,584,096	14,835,051	3,848,921
Hewn timber, feet, 1,200,824	1,852,563		1,007,082
Staves.....	5,119,876	2,591,511	452,500
Shingles.....	299,500	380,500	
Passengers.....	3,092	3,743	

## TONNAGE.

	1845.	1846.	1847, (to July 1.)
Number of schooners....	2,041	2,335	1,034
" steamboats and propellers.....	492	400	188
Number of scows.....	1,147	1,170	476
" rafts.....	104	120	39
Tonnage.....	312,571	385,969	181,236

A portion of the above returns comprise imports and exports from the Gore District, by the Grand river, and from ports on Lake Erie, Canada side.

## NOTE H.—Western Railway, Massachusetts.

Number of barrels of flour transported from Albany to Troy.

Year.	To Boston.	To other stations.	Total number.
1845,	181,796	146,386	328,183
1846,	331,930	163,919	396,839

Number of tons transported in eleven months of 1846.

Thro' from Boston to Albany, westward,	8,358
All other tonnage.....	40,251
Total going west.....	48,609
Thro' from Albany to Boston, eastward..	36,403
All other tonnage.....	81,382

Total going east.....	117,785
Total number of tons moved.....	166,394
Equivalent number of tons carried 1 mile, 15,748,223	
Equivalent number of tons carried over the whole road.....	100,950

Number of miles run by locomotives in eleven months of 1846.

For passenger trains.....	315,369
For freight trains.....	313,259
For gravel trains, etc.....	45,328
Total number of miles run.....	573,956

The income of the road for eleven months to November 30, 1846, has been,

Passengers.....	\$389,861 42
Freight.....	459,365 18
Mails, express, etc.....	29,191 29
Total income.....	\$878,417 87

Expenses for the same period have been as follows:—for

Road repairs.....	\$80,293 25
Engine repairs.....	48,909 25
Car repairs.....	40,544 06
Building, etc.....	16,195 02
Transportation expenses.....	202,524 45
General expenses.....	21,213 77
	412,679 80

Net income.....\$465,738 09  
The amount of earnings for December, 1846, have been \$76,000, which, added to the receipts for eleven months, will make the gross receipts of 1846, \$954,417 89, and an increase over the year 1845, of \$140,937 89.

## NOTE I.

When the railways on the most direct routes from Chicago to Boston and New York shall all be completed and furnished with heavy iron rails the traveller can pass from the former to New York in thirty-four hours, and in thirty-six hours to Boston, including all necessary detentions.

	Miles.	Conveyance.	Hours.
From Chicago to Detroit,	285	Day train	10
" Detroit to Niagara Falls.....	228	Night train	8
From Niagara Falls to Rochester.....	75	" "	21
From Rochester to Alb'y,	250	Day	81
" Albany to N. Y....	150	" "	5
" Chicago to N. Y....	987		34
" Albany to Boston, extra.....	52		2
To Boston from Chicago, 1039	miles in		36

On the completion of the Great Western, and the Syracuse and Oswego railways, the passage may be made from New York to Detroit, via Oswego and Hamilton, in thirty-six hours; from New York to Chicago in forty-eight hours; from New York to the Mississippi in sixty hours; and all the way to New Orleans in seven days, as follows:

	Miles.	Conveyance.	Hours.
From N. Y. to Albany....	150	Night steamer	8
" Albany to Oswego....	168	Day railway	8
" Oswego to Hamilton, 160		Night steamer	12
" Hamilton to Detroit, 185		Day railway	7
" Detroit to New Buffalo.....	240	" "	10
From New Buffalo to Chicago.....	45	Night steamer	3
Total.....	948		48

From Chicago to Galena in 10 hours, and by steamboat to New Orleans in five days.

Weather Table kept at Toronto, Showing the Amount of Rain, Snow, and Fair Weather, during each year, from 1840 to 1846, Inclusive.

Year.	No. of wet days.	No. of snowy days.	Perfectly fair.	Toronto Day frozen over.	Ice gone from Toronto Bay.
1840	97	56	213	6th December.	28th March.
1841	80	46	239	18th December.	12th April.
1842	89	55	221	Not noted.	17th March.
1843	83	73	209	13th Dec'r, but broke up again.	23d April.
1844	106	41	219	18th December.	Not noted.
1845	97	47	221	3d December.	Not noted.
1846	103	43	219	14th December.	8th April.

NOTE.—Any day on which rain falls, whether more or less, is noted as a wet day. The same observation applies to snow.

Severe cold seldom lasts more than three days successively during the winter; the weather then moderates for a few days, succeeded by a sharp frost. It is never so severe in Canada West as to put a stop to out door employment.

Greatest depth of snow three feet, seldom over two feet, the average depth about one foot.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

FOR PASSENGERS, SPECIE, GOODS, PARCELS, etc.  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise,] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.  
Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.  
July 31—3m  
ROBERT GRACIE.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved *Reading Locomotive and Car Axles*—drawn to any required pattern from *Bloom Iron* only. Address  
SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

**NOTICE TO CONTRACTORS.—ANDROS-COGGIN AND KENNEBEC RAILROAD.** Proposals will be received at the Treasurer's Office in Waterville, until the 25th of September next, inclusive, for the Grading and Masonry of the 3d Division of this road, extending from East Readfield to Waterville, about 30 miles.

Also, for such sections of the 2d Division as shall not be previously disposed of.

Profiles will be ready for examination on the 20th of September, and any information respecting the line can be obtained on application to the resident Engineers.

On the 24th of September the Engineer will be at Winthrop, and will be prepared to accompany contractors over the line of the road.

HOBERT CLARK, Agent A. & K. R. R.  
EDWARD APPLETON, Engineer.

Railroad Office Lewiston,  
August 25th, 1847.

3437

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

2m32

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

##### WELDED WROUGHT IRON TUBES

From 4 inches to 4 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2300 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**SPRING STEEL FOR LOCOMOTIVES, Tenders and Cars.** The Subscriber is engaged in manufacturing Spring Steel from 1 1/4 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

1y

**RAILROAD IRON.—400 TONS ENGLISH,** 60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
68 Broad Street, New York.

1m37

**FOR SALE.—300 TONS (10 MILES) FLAT** Bar Rail, in parcels or wholesale—section 2 1/2 inches wide by 1/2 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
Wilmington, Del.

1m37

**RAILROAD IRON.—500 TONS OF BEST** quality Bridge Rails, 53 pounds to the yard, to arrive, and for sale by

A. & G. RALSTON,  
No. 4 South Front Street, Philadelphia.

Also, a 2-hand Locomotive Engine, of Baldwin's make, for sale low.

September 8, 1847.

3437

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 22 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

#### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v19 1y

#### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabeth town and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

.. The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Euting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

#### MACHINE WORKS OF ROGERS,

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

##### Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
a45 Patterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.  
Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2 1/2 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =		
68,696 ft. b.m., at \$10 =		\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =		
4,403 ft. b.m., at \$13 =		57 24
13,000 Spikes = 2,250 lbs. at 44 cts =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 331f

## LAP—WELDED WROUGHT IRON TUBES

FOR

### TUBULAR BOILERS,

FROM 1 1/4 TO 6 INCHES DIAMETER,

and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

### ENGINEERS' AND SURVEYERS'

#### INSTRUMENTS MADE BY

EDMUND DRAPER,

Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.

ANDREW MENEELY.

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
124f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY Iron Company," Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents.  
1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,  
149 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolser of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

# **ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—**

for sale or imported to order by the subscriber.  
These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH

16	2¼	4	3	6	8	8	10½	7-16	7	

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schnylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLCOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,  
1y25 Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

**G. A. NICOLLS,**  
1y45 Reading, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

**WILLIAM ROE, Supt of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] **G. A. NICOLL,**

Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,]

**T. L. SMITH,**

Jersey City, November 4, 1845.

**N. Jersey Railroad and Transp. Co.**

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,]

**JOHN LEACH,**

Jamaica November 12, 1845.

# **THE SUBSCRIBERS, AGENTS FOR**

the sale of

Codorus,

Glendon,

Spring Mill and

Valley,

} Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**

59 North Wharves,

Jan. 14, 1846.

[1y4]

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by

A. & G. RALSTON  
Mar. 20th 4 South Front St., Philadelphia.

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 1½ to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,

Philadelphia.

ROBERT NICHOLS, Agent,

No. 79 Water St., New York.

**TO LOCOMOTIVE AND MARINE ENGINE** Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.

This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 119 Fulton street, New York.

J. BALL & CO.

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 9 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m., on arrival of the afternoon train from Portland.

WALDO HIGGINSON, Agent

**LITTLE MIAMI RAILROAD.—OPEN TO SPRINGFIELD.**—Distance 84 miles—

connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co's. daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston,

on the arrival of the boats from

Wilmington, N. C., in connection

with trains on the Georgia, and Western and Atlantic

Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculum Railroad in N. Alabama.

Fare through from Charleston to Montgomery

daily.....\$26 50

Fare through from Charleston to Huntsville,

Decatur and Tusculum.....22 00

The South Carolina Railroad Co. engage to receive

merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western

and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr., *Agent.*

THE WESTERN AND ATLANTIC

Railroad.—This Road is now in operation to

Oothcaloga, a distance of 80 miles, and connects

daily (Sundays excepted) with the Georgia Rail-

road.

From Kingston, on this road, there is a tri-weekly

line of stages, which leave on the arrival of the cars

on Tuesday, Thursday and Saturday, for Warren-

ton, Huntsville, Decatur and Tusculum, Alabama,

and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga

for Chattanooga, Jasper, Murfreesborough, Knoxville

and Nashville, Tennessee.

This is the most expeditious route from the east to

any of these places.

CHAS. F. M. GARNETT,

*Chief Engineer.*

Atlanta, Georgia, April 16th, 1846. 1y1

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, October 2, 1847.

ABSENCE for three weeks past, on business, has somewhat delayed the last three numbers of the Journal—for which we shall endeavor to make amends by renewed efforts in future.

### Richmond and Ohio Railroad Convention.

We publish at length the proceedings of a convention held at Lynchburg, Va., on the 22d of September, in relation to the proposed railroad from Richmond to the Ohio river.

It is not, we are aware, as interesting to many of our readers as some other matter would be; yet we give them in full, to show how "the spirit is moving" the people at the south, as well as the north and west.

We hoped to have been present at this convention, but circumstances prevented and led us in an opposite direction, where we could see and feel the astonishing influences of the railroad system. Boston, Worcester and Springfield, especially, are central points, which exhibit the almost magical effects of the system; yet even these places are only beginning to feel and exhibit these influences.

We coincide fully with the two first resolutions adopted by the convention, and hope to see "united and vigorous efforts" by the people of Virginia to carry through this—to them—all important work; as its completion and successful operation, will ensure the early construction of others, and give an impulse to enterprise which will make Virginia what she ought to be—a prosperous and leading State in the Union; but without it, she must continue to recede from her natural and noble position,

to that of—not a second, or even third, but—a fourth rate State.

### New York and New Haven Road.

We learn, from a New Haven paper, that "the engineers are now running their line across the harbor, including the Canal Basin, south of Union St., with a view to the permanent location of the route. More than 1500 men are employed between the western line of the city and New York. The whole route is now under contract, and the work is progressing with great rapidity."

The Keene Sentinel observes that "the stock is also taken for the continuation of the Connecticut River railroad from Greenfield to the line of Vermont. This will give a continuous railroad track from New York city to within eighteen miles of this village, where, if the inhabitants along the Ashuelot valley exercise a slight degree of energy, it will connect with the great lines north of us, as a matter of interest and we believe at a great saving of expense. A handsome subscription for the survey of the Ashuelot road is already made here, and we trust our friends in Swanzey, Winchester and Hinsdale will exert themselves to make up the balance necessary, that the survey may be made without delay; and an argument presented to the stockholders of the Connecticut River road, in favor of a connection here, which we think will prove a conclusive one."

### The Three C-C-C's.

Much interesting matter will be found in our paper to-day, says the Cleveland Plaindealer of 15th September, relating to the Cleveland, Columbus and Cincinnati railroad. We have nailed the above "C's" to our mast-head, and we are not going to slacken steam on this road, until we have in sight of the Queen city with a forty car train.

No one could have listened to the statements of Alfred Kelley, president of the board, at the Empire Hall meeting, without being convinced that this road, above all others, is destined to be one of the greatest thoroughfares for business in the whole country. It crosses diagonally the richest grain-growing State in the Union, and connects the two greatest channels of trade and travel in the west and southwest.

We are happy to see that under the present efficient head of the board, the work is to be immediately commenced. We have been favored with the following extract from the minutes of the board of the Cleveland, Columbus and Cincinnati railroad:

CLEVELAND, September 7th.

Mr. Payne offered the following resolutions:

Resolved, That the grading and bridging of so much of the Cleveland, Columbus and Cincinnati railroad company—connecting at or near the city of Cleveland, and extending in the direction of Columbus, not less than ten miles in length, as can be definitely settled upon as part of the best route—be prepared for letting and put under contract as soon as practicable. Adopted unanimously.

Resolved, That Messrs. Hilliard, Woolsey and the president, be a committee to procure competent engineers, and cause careful surveys and estimates to be made with all convenient speed, of two routes for a railroad between Cleveland and Columbus, suggested to be the most practicable and advantageous by Mr. Child. Adopted unanimously.

### The Iron Business.

We find in that excellent paper, the Philadelphia Commercial List, of 28th August, the following remarks on this important, and rapidly increasing, branch of business. The editor says that "the substitution of iron in place of wood, stone and other materials for various purposes, of late years, has rapidly increased the demand for this indispensable article to the extension of civilization. The uses have become so varied that the demand, notwithstanding an unexampled increase in the quantity of pig iron produced, has more than kept pace with the increased manufacture. Pennsylvania, being the centre, from which more than half the Union derive their supplies of iron and coal, is increasing in popula-

tion and wealth beyond any of her sister States on the seaboard. During the last three years a large number of rolling mills for the manufacture of railroad iron have been erected, and are now in successful operation. The aggregate quantity of this iron produced in 1837 will amount to nearly 60,000 tons. This quantity will require 80,000 tons of pig metal for its construction, and will consume 300,000 tons of coal in the various stages of its manufacture.

"Add to this the quantity of pig metal used in castings of various kinds, particularly for water and gas pipes, and it will be seen that the aggregate amount is very large. At the present period, the city of Boston requires 10,000 tons of cast iron pipes for their water works. The city of Charleston wants eighteen miles of gas pipes, 8, 6, 4 and 3 inches in diameter. Norristown, a place that in 1840 numbered only three thousand inhabitants, is now laying 23,000 feet of cast iron pipes, 10, 8, 6, 4 and 3 inches in diameter, 8,000 feet of them 10 and 8 inches, for the purpose of supplying the borough with water. In various other places large quantities of iron pipes are also required for similar purposes. This greatly augmented demand will have the effect of sustaining the prices of pig iron; and will, we think, satisfactorily account for the scarcity of the article at the present time in our market, and furnish a sufficient argument for the erection of more furnaces.

"In 1848 the present rolling mills, and those in progress, will be able to produce 100,000 tons of rails."

#### Railway Movements at the East.

The Boston Post thus speaks of the movements in relation to railroads in that region. It shows that, in *New*—as in *Old*—England, the remark will hold good, "that the railway system will be extended until every town, of any considerable importance, has its railway facilities."

"The Erie railroad is stated to have seven thousand laborers now at work upon various sections. It has not been determined to lay the wide gauge track, and the extra cost makes a serious item which some think its advantages will not compensate.—Proposals have been invited for grading, etc., of the Ogdensburg railroad, from Ogdensburg to Malone, which shows the directors to be in earnest, and not to be diverted from their purpose of taking the best line by local or interested clamor. The Northern extension railroad is now open thirty-seven miles beyond Concord, and Lebanon is promised to be reached by a train of cars in all December. A portion of the Concord and Montreal road, that between Concord and Meredith bridge, will probably be in readiness this fall. To-morrow the first train of passenger cars will be run over the Vermont and Massachusetts railroad, from Fitchburg to Baldwinville. The rails have been laid upon the Cheshire road from Ashburnham to five miles beyond Winchendon, but the rock cut near the junction with the Vermont and Massachusetts road cannot be laid open to grade line before October 15th. When the rails can be laid there, a train of cars will meet no impediment until Fitzwilliam is reached. An unexpected delay has arisen from the same cause—a heavy rock cut—upon the Providence and Worcester railroad, which cannot be open for travel until the middle of October. It is said the two ends of the road are nearly ready for the trains, and might be put in operation in a few days. The Salem Gazette says the work on the Essex road is advancing at such a rate as will insure its being ready for the rails in December.

"The Lawrence and Manchester railroad subscription of stock resulted in three millions of dollars

being subscribed for half a million of capital. Londonderry and Derry are striving for the location of this road to suit their respective wants of railroad facilities. Mr. Not is making a final survey and location, so that a commencement will soon be made upon the grading and bridging. In view of this new line of railroad between Boston, Concord and New Hampshire, Vermont, etc., the market value of Lowell railroad stock has declined materially, with sales at 16½ per cent. advance. Worcester railroad stock has fallen also, for the reason that a large purchase of land at a high price has recently been made, which is reported to have been offered to the corporation a few years since at much lower rates."

#### Annual Report of the Harrisburg and Lancaster Railroad Company.

We have received a copy of the annual report of this company—from which we learn that the working condition and machinery of the road have been much improved during the past year—and also that its financial condition is assuming a more promising aspect.

It will be seen by this report that the company have assented to the proposed tax on tonnage, as provided in the charter of the Pennsylvania Central railroad, and thus secured its connection with that important work, and also its ultimate prosperity.

The meeting of the stockholders was held at their office in this city, on the 3d of September, when the president of the board of directors presented and read to the meeting the annual report for the year ending August 31st, 1847.

#### REPORT.

The board of directors of the Harrisburg, Portsmouth, Mounjoy and Lancaster railroad company, beg leave to submit to the stockholders their annual report, showing the condition of the company on the 1st day of September, 1847, and tabular statements of the business for the past fiscal year.

It will be seen from the statements annexed, that the receipts of the company from all sources have been \$114,030 47, for the year ending September 1, 1847, being an increase of \$20,926 66 over those of the previous year.

Since the last annual report of the directors, the unfinished part of the road has been completed, and the whole line from Dillerville to Harrisburg, has been repaired and put in complete order.

The bridges and culverts along the road have all been kept in good repair. The two stone piers, mentioned in the last report as then being built under the bridge over the Swatara creek, have been finished, and the bridge itself has been thoroughly repaired. This bridge is now in so good a condition, that it will in all probability last for a number of years, with but little, if any, expense to the company.

The board have constructed two additional trestles under the Conawago bridge, taken out a portion of the old timber and replacing it with new, and have relaid the flooring and otherwise repaired and strengthened the structure. The bridge across the little Conestoga creek, and that over the small canal at Middletown, have both been renewed.

The tunnel near Elizabethtown, the only one on the road, is a well built structure; it is now in good condition and has been kept well drained.

The weight scales at Harrisburg and Dillerville, are in excellent order. The old scales at Dillerville were recently taken up, and new ones laid in their place, on granite foundations. These scales were manufactured by Messrs. Ellicott & Abbott, and have proved in all respects equal to those on the company's road near Harrisburg.

In consequence of the increase of business over the road, the old sidings at Dillerville have been removed, and a new turnout, over 1500 feet in length, is now in process of construction, which will greatly facilitate the business at that point. There has been a new turnout laid down at Highspire, upwards of 500 feet long. The passenger trains now pass each other at this place, instead of Middletown, the former passing place. By this new arrangement the morning train from Philadelphia is always enabled to make a considerable gain of time, frequently reaching Harrisburg before the leaving of the afternoon train for this city. The other train, (the night line) from Philadelphia, now reaches Harrisburg before the 8 o'clock morning train leaves that place, furnishing in this way, another important accommodation to the travelling public.

The real estate, and other property of the company at Harrisburg, have been much improved since the last annual report. The water slips at that place have been cleaned out, and the wharves repaired. Two of the warehouses have also required particular attention; the foundations which had given way have been in part rebuilt, the flooring has been repaired, and part of the superstructure replaced with new timber. New curve tracks have been laid down to all the warehouses. The property of the company at this place is large and valuable. It is advantageously situated on the Pennsylvania canal, and will become the place of connection between the road of this company and the Pennsylvania railroad. It now rents for \$1950 per annum.

The passenger depot at Harrisburg will require some alterations and improvements. It is not sufficiently large to accommodate the travelling public, and protect the cars from the weather.

The machine shop and machinery have been thoroughly repaired. A new and powerful sliding lathe for turning and drilling has been put up, which will greatly facilitate the operations of the workmen.

In consequence of the underwash on the river bank, from the frequent freshets in the Susquehanna, the board of directors have found it necessary for the preservation of the road, to build a slope wall a considerable distance along the bank of the river. This wall is now nearly completed.

Since the road has been substantially improved and completed, the running time for the passenger trains between Harrisburg and Dillerville seldom exceeds two hours, including stoppages. Previous to this improvement it was frequently three. This increase of accommodation to the public, has largely promoted the interests of the company, by increasing the travel over the road. The com-

pletion of this work of improvement also enabled the company to enter more extensively into the transportation of freight, and arrangements were accordingly made for that purpose. It was found necessary from the great increase of business, in the way both of passengers and freight, to procure more powerful engines to do the business of the road.

A contract was accordingly made with M. W. Baldwin, Esq., on the 10th of February last, to build for the company, a heavy six-wheel connecting freight engine, to be finished in time for the commencement of the spring business. This engine, called the Washington, was completed and running on the road in less than five weeks from the period of first making the contract. The work performed by this engine when in use, has been found to be more than equal to any other three of the company's best engines; while the running expenses of the Washington for each trip, was but one dollar more than that of each of the smaller engines. The capacity and power of the Washington have fully met the expectations of the board, and her performance thus far entirely sustains the guarantee of the maker.

Another contract was subsequently made with Mr. Baldwin for an eight-wheel engine, with four driving wheels connected, combining both power and speed, to be used for both passengers and freight.

This engine was placed on the road the 22d of August last; it has not as yet been sufficiently tried to test its power and speed. The board, however, have no doubt its performance will prove quite as satisfactory as the other, for the purposes intended.

The cost of these two engines is \$14,093. Two of the old engines being no longer needed, have been disposed of. The other locomotives belonging to the company, six in number, are all in good order, and will require but little repair for the coming year.

The board of directors take great pleasure in being able to make an exhibit to the stockholders of the financial affairs of the company, in their present greatly improved condition. The difficulty and embarrassments, under which they labored for a long time, have been almost entirely removed. The debt due the Messrs. D. & J. Salomons, of London, which was secured by the assignment, has been paid off, and the lien removed. The trustees under this assignment, have therefore been enabled to restore to the board of directors the control of the property and income of the company, which are now under their exclusive management and direction. This important arrangement was accomplished in June last, by borrowing \$40,000, at an interest of 6 per cent payable in 10 instalments, of \$4,000 each; the last falling due on the 15th of June, 1848. Two of these instalments, amounting to \$8,000, have been already met at maturity. After applying the proceeds of the above loan to paying the claim of the Messrs. Salomons, amounting to \$36,072 29, the balance was paid to Messrs. Betts, Pusey & Harlan, in satisfaction of a judgment which they held against the company.

The directors are unwilling to let this op-

portunity pass, without expressing their thanks and those of the stockholders, to the trustees (Messrs. Fraley, Lex & Linnard,) for their faithful discharge of the duties devolving on them by virtue of the trust referred to, and for the courtesy and fairness which has characterized their intercourse with the board, during the whole time of its existence.

In reference to the business of the road for the past year, the board believes that the stockholders have great reason to congratulate themselves with the result. Although the general expenses may appear large, they will bear in mind, that since the last annual report, the board of directors have purchased two new and powerful engines, at a cost of over \$14,000, which are worth that money at the present time; they have also paid near \$3,000 damages for using patent curves. It will further be seen by the last year's report, that the expenses for August, 1846, were not included in the expenses for the last fiscal year. The new track, which was not then finished, has been since completed at a cost of upwards of \$20,000. These extra expenses, amounting to more than \$36,000, should not be estimated in the ordinary expenses of the road.

The great objects for which the board have been for a long time anxiously laboring, have been accomplished, viz: the renewal and improvement of the road, and the raising of the assignment. The company is now enabled to work the road at much less expense than formerly; and in addition to this, the business over it has increased and must still further increase largely; so that hereafter there will be, from the profits of the road, a considerable surplus left after paying the current expenses and the interest on the loans. The surplus the board think should be applied to the liquidation of the present floating debt of the company, amounting to only \$47,000.—Having accomplished this desirable result, regular dividends of the profits to the stockholders may be expected, without any apparent probability of their interruption for the future.

An energetic commencement has already been made in the construction of the Pennsylvania railroad; and as the value and importance of the road belonging to this company is greatly increased by the connection with that great undertaking, the board beg leave to refer the stockholders to the 11th section of the Act of Assembly, passed April 13, 1846, incorporating the Pennsylvania railroad company: which section provides for the connection of that road with this company's road, in the following words:

"Beginning at and uniting with the western terminus of the Harrisburg, Portsmouth, Mountjoy and Lancaster railroad, in the borough of Harrisburg, provided said Harrisburg, Portsmouth, Mountjoy and Lancaster railroad company shall be subject to, and consent to the same rate of tax on tonnage, for the use of the State, as is provided in this act to be paid by the Pennsylvania railroad company; and in case the said Harrisburg, Portsmouth, Mountjoy and Lancaster railroad co. should not agree to comply with these conditions within three months after the distance of fifteen miles from Harrisburg, westward,

shall bona fide be put under contract, the said Pennsylvania railroad company are authorized to connect this road with the Columbia railroad, at or near the borough of Columbia, in Lancaster county," etc.

At a stated meeting of the board of directors, held January 2, 1847, the above provisions of the 11th section of the said act were laid before the board; and at a subsequent meeting, held August the 28th, the following preamble and resolutions were read and taken up for consideration, viz:

Whereas, the Act of the General Assembly of Pennsylvania, passed the 13th of April, 1846, incorporating the Pennsylvania railroad company, provides in the 11th section thereof, that the consent of this company shall be given to certain conditions therein referred to, within a specified period; and whereas, the board of directors of the Pennsylvania railroad company did, on or about the 15th day of July, 1846, bona fide, put under contract the distance of fifteen miles of the said road from Harrisburg, westwardly, therefore,

Resolved, That the Harrisburg, Portsmouth, Mountjoy and Lancaster railroad company hereby consents to be subject to the same rate of tax on tonnage, for the use of the State of Pennsylvania, as is provided to be paid by the Pennsylvania railroad company, during the same periods and under the same terms and regulations as is provided in the Act of the General Assembly of the State of Pennsylvania, entitled, "An Act to incorporate the Pennsylvania Railroad Company," passed the 13th day of April, A. D. 1846.

Resolved, That the president of this board be and he is hereby directed to inform the Secretary of State, and the president of the Pennsylvania railroad company, of the consent of the Harrisburg, Portsmouth, Mountjoy and Lancaster railroad company, granted by the foregoing resolution, and to furnish them with copies thereof, to be respectively laid before the Governor of the commonwealth, and the board of directors of the Pennsylvania railroad company.

Whereupon the following resolution was unanimously adopted:

Resolved, That the foregoing preamble and resolutions be referred to the stockholders at their annual meeting on the 3d of September proximo, with the recommendation that the same be adopted by the stockholders.

All of which is respectfully submitted.

By order of the board of directors,  
JOSEPH YEAGER, President.

September 3, 1847.

*Statement of the whole Receipts and Expenditures of the Company for the fiscal year, commencing September 1, 1846, and ending August 31, 1847; also with the balances of cash on hand, taken from the accounts of the trustees, to the 1st of June last, from the former and present treasurer and superintendent.*

VAL. HOLMES, Treasurer.

Philadelphia, Sept. 1, 1847.

A Statement of the General Expenses of the Company from 1st August, 1846, to 1st September, 1847 (13 months), including the amount expended by the superintendent for repairs, materials, workmen, & reconstructing road, etc.

1. Repairs of roadway, bridges, culverts, and superstructure, between Elizabethtown and Dillerville.	\$2,534 05
2. Repairs of roadway, bridges, culverts, slopewall and superstructure between Elizabethtown and Harrisburg.	6,883 93
3. Repairs and improvement of depot, machine shop, warehouses, water slips, water stations, new weigh scales, etc.	1,913 16
4. Repairs of locomotives, tenders, and construction of new turning lathe.	4,640 04
5. Repairs of baggage and passengers, cars, etc.	1,189 96
6. Expense of wood.	4,357 88
7. Expense of coal.	706 43
8. Expense of oil and cotton waste.	940 38
9. Wages of enginemen and firemen.	4,508 25
10. Wages of laborers engaged in pumping water, tending switches, sawing wood, watching depots and bridges.	3,065 88
11. Expense of carrying mail to postoffices.	250 00
12. Salaries of superintendent, collectors and conductors.	3,549 81
13. Hire of locomotives and cars to D. Lapsley, trustee.	1,017 39

34,877 16

14. Amount paid by superintendent for materials and labor in reconstructing company's road.	20,051 81
15. Insurance on property, and taxes.	1,349 10
16. Salaries of president, treasurer and secretary, with office expenses, rent, printing and stationery, in Philadelphia and Harrisburg.	3,438 60
17. Damages, attorney's fees, & legal expenses, etc.	3,333 91
18. Expenses of trust, paid trustees and secretary to June 1 last.	1,600 00
19. Old debts paid, incurred prior to 7th September, '42.	20 00

29,793 42

\$64,670 58

After the reading of the report—

On motion, it was unanimously Resolved, That the thanks of the stockholders be and the same are hereby tendered to the board of directors, for the energy, ability, fidelity and success, with which they have conducted the affairs of the company, during the last fiscal year.

On motion, Resolved, That this meeting do now adjourn, to go into an election for directors of the company, and meet again at four

o'clock, P.M., to here the report of the judges of the election.

The meeting convened at 4 o'clock, P.M., same day, when the judges reported that the following gentlemen were duly elected directors of the company for the ensuing year:

Joseph Yeager, Seth Craige, Wm. Ford, Algernon S. Roberts, Francis R. Wharton, Henry Buehler, (Harrisburg,) L. M. Tronman, John N. Lane, (Lancaster,) Robert Allen, Dr. John Holmes, David Lapsley, Geo. Taber, Robert V. Massey.

On motion, Resolved, That this meeting do now adjourn.

T. M. PETTIT, Chairman.

S. W. ROBERTS, Secretary.

JOSEPH YEAGER, Esq., was re-elected president, and VAL. HOLMES secretary and treasurer for the ensuing year.

## New England Roads.

The Boston Courier says that the railroads radiating from that city were never doing a better business than at present, and then adds:

"More is heard of the Western than any other, and more interest is generally felt in its success on account of its being the main artery, and in one sense public property. Its receipts last week were over \$30,000, and the whole gain since the 1st of December, the beginning of the present financial year, to the present time, has been over one thousand dollars for every working day. This result is gloriously triumphant."

Very true, but the beginning is hardly yet.—[Ed. R. R. J.]

## Report on the Preliminary Surveys for the Milledgeville and Gordon Railroad.

ENGINEER'S OFFICE, Aug. 31, 1847.

To Col. Seaton Grantland, Dr. Tomlinson Fort, and Col. William S. Rockwell, Committee on Survey, Milledgeville and Gordon Railroad.

GENTLEMEN:—The survey of a route for the proposed railroad from Milledgeville to Gordon, which was entrusted to me, having been brought to a close, and the estimates of cost being also complete, it becomes my duty to submit the following

## REPORT.

The survey was commenced on Tuesday, the 3d instant, at the east end of the turn out at Gordon, and carried in the direction N. 42 E. until it approached the neighborhood of Commissioner's creek, when it was made to assume a more northerly direction. This portion of the line is not remote from, and pursues a course nearly parallel to the public road leading from Gordon to Milledgeville—the line lying on the western, or left hand side. Mr. Folsom's house is a short distance to the left, Mrs. Ganey's some two hundred yards on the right; Pattishall, who lives a short distance from the road, and near Commissioner's creek, being again a short distance on our left.

The direction of this portion of the route is too much easterly for a direct line from one terminus to the other. A line more in course would have passed considerably to the left or west of Pattishall's. But the summit between Little and Big Commissioner's creeks rises in this direction into an elevated

ridge, which, however, subsides to the general elevation of the level on which Gordon is situated, near Pattishall's house—which will account for the line we run having been preferred. It may be well to notice, that a gap exists in the ridge alluded to, which, if practicable, would give the line a much more favorable direction at the start—leaving Pattishall's considerably to the right, and reach Commissioner's creek, near King's. Success by this route was too uncertain to warrant, considering the time at command, its being tried.

In fact, the point at which this ridge was crossed, and which it is believed is considerably lower than the gap alluded to more to the left or west, was found to be at such an elevation above the creek—viz., one hundred and twelve feet, (and forty-five feet above Gordon,)—as at once to throw us upon the adoption of a rather high rate of grade—or submit to an additional expense for grading, which it was believed circumstances did not render advisable.

While alluding to the subject of grades, it may be as well to add, that while a high rate of grade limits the capacity of a road—or, to afford an enlarged capacity, involves the necessity of a more perfect and expensive superstructure, and especially a rail of greater strength and weight, and heavier and more expensive engines and equipments, and consequently increased wear and tear and expense of maintenance for both road and machinery—still, it should be considered whether, in this case, the amount of business is likely to exceed the limited capacity which will be the result of high grades, with a road and equipments of the ordinary character.

The highest grade adopted on any of the northern roads, with a view to locomotive power, is eighty five feet to the mile. This is upon the Western railroad between Boston and Albany. The immense business done upon that road is the result of the superior character and cost of the road and equipments already alluded to. The highest grade yet adopted in this State is believed to be about forty feet to the mile. The maximum upon the Central railroad is thirty feet—with engines weighing from fourteen to seventeen tons, twenty cars, carrying eight hundred bales of cotton, are taken over the road. It will be perceived at once how much this could be reduced, and still come within any demand upon the business capacity of the work which is had in view.

The fact, which it may be well to notice, that a line carefully surveyed in 1838, under the direction of L. O. Reynolds, Esq., by order of the Central railroad company, to test the practicability of carrying the Central railroad by the way of Milledgeville, and passing over ground not varying very considerably from that occupied by the present line for a large portion of the distance, was estimated to cost for grading alone, at a maximum of thirty feet, \$25,000 per mile, shows in itself the necessity of yielding to pretty high grades.

Believing, therefore, that the amount of business likely to offer did not demand, and

that the means at command would not warrant the adoption of light grades, the survey has been made with reference to grades of sixty feet to the mile, and on this the estimates are predicated.

I would distinctly state in this connection, however, that it is by no means certain that future examinations will not lead to such developments as will enable the grades to be somewhat reduced, without materially affecting the distance or cost. I feel quite confident, in fact, that no grades of much over fifty feet to the mile will ultimately be required—still keeping the expense within the limits of the present estimates. Indeed, without departing from the line surveyed, the grades might be reduced to fifty-two and eight tenths feet per mile, (or one foot to the hundred,) without vastly increasing the cost.

I will take occasion here to dissuade from any precipitancy in adopting this or any other route—feeling sensibly, as I do, the importance of taking the first step aright. While the survey just closed may, I think, pretend to all the accuracy and detail of preliminary surveys in general, it would be rather remarkable if the best route throughout had been selected. Other routes, and amendments of the route surveyed, possessing high claims to favor, are believed to exist, which will be particularly alluded to before this report is closed. Until these examinations are made, the present estimates may be relied upon, and any improvements in the line which may reward further investigation, will be clear gain. In other words, we are now viewing the matter in the most unfavorable light in which it can in any event be presented.

The line enters Commissioner's creek swamp about half a mile above, or west of the road from Gordon to Milledgeville. The swamp at this point is found to be about seventeen hundred feet, or one third of a mile in width. For one-half of this distance it will be advisable to support the road on trestles, placed at intervals of ten feet, and supported in their turn upon piles, driven to a firm foundation. The height of the bridge will require to be from fifteen to eighteen feet. If the elevation of the bridge could be governed by high water mark, eight feet would be sufficient. This additional elevation is necessary in order to support the grade, owing to the fact already alluded to, of the crest of the hill, or rather of the table land lying between the creek and Gordon, being one hundred and twelve feet above the creek.

The line emerges from the swamp at the mouth of a hollow, which had been held in view as affording possibly a means of surmounting the ridge on the north side of Commissioner's creek, and between that and Beaver creek, which would have favored the general course of the line. A line was carried up this hollow until the summit was attained a short distance west of John Ganey's house, when finding it to be one hundred and thirty-eight feet above the creek, and involving us in a lengthy cut of thirty-five feet, it was abandoned. This line was productive

of the fact, that no eligible line could be had in a direct course across this ridge. The alternatives presented were, to deflect to the left, and follow a branch or hollow which would ultimately conduct us to the summit of the ridge in question, at a point which would enable us to head Beaver creek, leaving it entirely on our right; or to drop down to the mouth of Beaver creek two and a quarter miles below the Gordon and Milledgeville road, and leave the ridge in question on our left. Provided Gordon were still made the point of departure from the Central railroad, it was believed this course would add considerably to the distance. The former plan was therefore adopted, and the hollow or branch alluded to, which runs into Commissioner's creek something less than three-quarters of a mile above the Gordon and Milledgeville road, was pursued to its head—by which the summit was reached with a short cut of thirty-one feet. The line up this hollow, with the exception of the cut at its head, is highly favorable.

Having attained the ridge between Commissioner's and Beaver creeks, the direction of which is here such as to suit our purpose, the line then pursues it to what may be called the summit between Commissioner's and Camp creeks—and which is the highest ground reached during the survey. This is a prolongation of the Scotsborough ridge. The line is here about one mile and a half to the left or west of the Gordon and Milledgeville road. At several points on this ridge, between the line and Pondexter's house, Milledgeville can be distinctly seen—a sufficient proof of the elevation, did not our level notes apprise us that in the depression where this ridge is crossed by the line, the elevation is four hundred and ninety-eight feet above tide, one hundred and fifty-five feet above Gordon, and one hundred and eighty-eight feet above Milledgeville.

Having passed this ridge with a moderate cut, the line descends along the slope to Camp creek, reaching it near where the bend is made in its general course from south east to north east, in what is called the Ivy settlement. After pursuing its right side for a short distance, the line crosses it near the residence of Charles Ivy, and continues down along the north western slope, over inviting ground, until a point in Col. Grantland's plantation is reached, where the valley of Camp creek is left, and the line carried at the maximum grade in a tolerably direct course to the depression in the ridge between Camp and Fishing creeks, in front of Oglethorpe University.

The average descent of Camp creek, so far as pursued by the line, was found to be about twenty-two feet per mile.

The ridge between Camp and Fishing creeks has, I believe, been always regarded, by those conversant with such matters, as the principal obstacle on the route, and by some, entirely unattainable, with practicable grades, at a reasonable outlay. The result, at this point, may then be regarded as favorable. A cut of thirty feet across the ridge, in front of the University, enabled us to reach and cross

Fishing creek with a short fill of about forty feet.

The route from the College ridge to Milledgeville follows a small branch, which has its rise at the college spring. After pursuing it for about half a mile, the branch bears to the left. At this point it crossed by the line, which pursues a direct course to Fishing creek, and after crossing it about three hundred yards above the cemetery, terminates on the Government square, near the intersection of Greene and Columbia streets, at the elevation of three hundred and ten feet above tide—being thirty-three feet lower than Gordon. By reference to the map it may be seen that by starting from the Central railroad about one mile below Gordon, the distance would be lessened about half a mile, and the ground is believed to be equally favorable. But it will be worth while to consider, whether this would warrant the establishment of a new depot, with a warehouse and other conveniences.

On the subject of the best site for the depot in Milledgeville, little need be said at this time. That is a subject for deliberate consideration. The site which will afford the greatest convenience to the citizens generally, with the least outlay, should, of course, be adopted. Fishing creek, it may be as well to state, was crossed, under favorable circumstances, in reaching the terminus upon the Government square. A different route was pointed out, crossing Fishing creek above the cemetery, and running up Wilkinson street to near Greene street, from which point a horse track could be run to the Penitentiary along a hollow leading in that direction, at a small expense. Whether the City Council would grant the privilege of establishing a depot at this point, coupled with that of using locomotive power in the city, or whether it would comport with the interest and safety of the city, is for others to form their conclusions. The cost, it is believed, would be something more, though not amounting to serious objection. Should a depot be established without the business part of the city, any apprehensions, (and such appear to exist with some,) that business would leave its accustomed channels and resorts, and collect around the depot, are, judging from all experience on that subject, utterly groundless.

The routes which have been alluded to, as deserving examination previous to the definite location of the road, I will now proceed in a few words to notice.

The first would leave Gordon at the same point, and taking a more westerly course, pass through the gap west of Pattishall's, cross Commissioner's creek, as high as where William Harrold lives, and from thence grading up along the northern slope of the creek, reach a stream called Muddy Branch, which would bring us upon the present line about six miles from Gordon, and near Betsy Smith's. The line as run passed to the left of her house, but it is believed that the summit between Commissioner's and Camp creeks, could be crossed on equally favorable terms, and effect a small saving in distance, by passing to the right of Betsy Smith's, and

crossing the summit about a third or half mile east of the present line.

Another route is to drop down to the mouth of Beaver creek, and thence up that stream to near the Gordon and Milledgeville road, thence taking the general direction of the road, cross the summit between Commissioner's and Camp creeks, (or rather it might here be called the summit between Beaver and Camp creeks,) a little west of Poindexter's, thence passing near William Woolsey's, and leaving the hollows of Black creek on the right, fall gradually into the valley of Camp creek, and join the present line near Mrs. Bower's ford. A route might be worth examination, from Poindexter's, crossing some of the heads of Black creek, and leaving Hubbard's to the left, cross the Scottsborough ridge near Wiley Cullens', and thence pursuing a small branch past Joseph Slade's, again join the present line in the valley of Camp creek. It is feared the ridge at this point will prove too high, however.

A route has been suggested by a gentleman whose opinions on all subjects carry much weight, which, instead of crossing the Scottsborough ridge at Cullens', would fall into the head of Reedy creek, and leaving Scottsborough to the left, or west, cross Camp creek near its mouth, and thence follow up the Oconee to Milledgeville. The result of a partial reconnaissance of this route was not unfavorable.

It is highly probable that the route crossing Commissioner's creek at the mouth of Beaver creek, and thence as indicated, passing near Poindexter's and Woolsey's, would afford easier grades than the route surveyed, but the distance, it is believed, would be unfavorably effected. By starting from the Central railroad, however, about one and a fourth miles below Gordon, the ground being equally favorable, this route would be shortened to that extent, in which case it might not compare very unfavorably with the present line in that respect.

A different route from that surveyed from Camp to Fishing creeks, will now be noticed, of which a careful reconnaissance was made. This would leave the present line in the valley of Camp creek, at a point near Col. Grantland's quarter, and bearing to the left up a small stream which heads on the south side of the college ridge, and from a third to a half mile in the rear of the college, cross the Midway ridge at a highly favorable point near Mr. Orme's gin house, and thence falling into the south prong or hollow of Bailey's branch, pursue that to Fishing creek, a short distance below the Macon bridge.

I advance the opinion with much confidence, that this, all things considered, will afford the best line from Camp to Fishing creek, and involve also, less danger of encountering rock in the summit cut, which is a matter that should be specially attended to in the final location of this part of the line, as indications of rock (mica slate,) were observed.

There is one other route to which I will barely allude. This would cross the Oconee

near Milledgeville, and pursuing the valley of the river over extremely favorable ground, form a junction with the Central railroad at station no. 14. The distance would be about twenty-two miles. The grades could be kept within the lowest desirable maximum. The bridge across the Oconee might be so constructed as to be used (as a toll bridge) for public convenience. The rate of cost per mile of the line surveyed would be more than sufficient to construct the road on this route. It is for those interested to consider, whether this connection would afford any superior advantage over the connection at Gordon. The following is an extract from the report of L. O. Reynolds, Esq., to the Central railroad and Banking company, on the survey before alluded to:

"It may be proper here to mention that the country on the east side of the Oconee affords a most favorable route for the construction of a railroad from Milledgeville to our line. The grade would be almost one uniform inclination, and the low lands bordering on the Oconee swamp, would require little excavation and embankment to form the road bed."

The plan of superstructure upon which the estimate is based, is that of the Central railroad. Any other form would not materially effect the cost.

The rail which is proposed, is the flange rail, of thirty-six tons to the mile. This form of rail was invented by a distinguished engineer of this State, and thus far has been only used in Georgia. But experience thus far has shown, that at a small cost it affords much of the smoothness and durability of a good T iron. The spike holes instead of perforating the centre of the bar, as in the ordinary plate iron, are through what is called the *flange* on the outer edge of the bar; this flange being sufficiently thin to admit of the spike heads being driven below the surface of the rail. This form of iron has no tendency, like the flat bar, to break at the spike holes, or to form *snake heads*. Much of the roughness of the flat bar is owing to the weakness of the iron at the spike holes, and in travelling upon a flat bar road, a concussion or jar may be felt at almost every spike. The case is very different with the flange rail.

With the abundance of excellent timber which the forests of Georgia afford for continuous bearings, the flange rail will be found to approach much nearer the T pattern, laid on detached bearings, or cross ties simply, than might be supposed.

A map on a scale of two thousand feet to the inch, and a profile on a scale of four hundred feet to the foot vertical, and eight thousand feet to the foot horizontal, are herewith presented. By the former it will appear that the distance is sixteen and a half miles, though the distance as measured was seventeen and a quarter. A located line will not exceed the distance first mentioned.

In preparing the estimates, the line has been divided into sections of three miles each, except the last, which is two and a quarter. As this exhibits the relative cost of different

portions of the line, the estimates are presented in this form. To cover the contingency of encountering rock, the whole distance as measured has been estimated, except for the superstructure, which is estimated at 16½ miles.

To be Continued.

#### RAILROAD CONVENTION.

The delegates appointed by the several towns and counties, interested in the Richmond and Ohio railroad, met, pursuant to notice, in the Universalist church, in Lynchburg, on Wednesday, the 22d of Sept., 1847.

On motion, the meeting was temporarily organized by calling to the chair Major Jas. Garland, and appointing as secretaries Wm. M. Blackford and Robert H. Glass.

The proceedings were opened with prayer by the Rev. W. S. Reed. The following delegates appeared and took their seats:

*City of Richmond.*—C. Dimmock, R. R. Duval, Joseph R. Anderson, Thos. H. Ellis, Edwin Robinson and James Lyons.

*Lynchburg.*—Henry Davis, Rev. J. Early, John M. Speed, Richard K. Cralle, F. B. Deane, Jr., Joseph K. Irving, Dr. Robert S. Payne, Maj. Jas. Garland, R. J. Davis, Wm. T. Yancey, Dr. J. V. Hobson, W. M. Blackford, Wm. S. Reid, Jr., D. E. Spence, R. H. Gray, R. E. Manson, R. Glass, R. Cawthon, D. R. Edley, D. I. Warwick and J. Wills.

*Amherst.*—J. D. Davis, D. W. Patterson, C. P. Lee, R. M. Brown, S. M. Garland, H. W. Quarles, W. Jones, F. V. Sutton, Jas. P. Garland, R. G. Morris and E. L. Shelton.

*Montgomery.*—Dr. J. B. Radford, Maj. E. Hamet, and Col. David Barnett.

*Bedford.*—R. Allen, W. M. Burwell, W. C. Irvine, J. F. Johnson, Col. G. B. Board, J. O. Leftwich, and Dr. H. Harris.

*Campbell.*—E. B. Withers, M. B. Nowlin, J. C. Murrell, E. Page, J. Irvine and Dr. R. B. Withers.

*Wythe.*—G. C. Kent, P. S. Buckingham Cabell.—Peter Clarke, F. G. L. Buehring.

On motion of Mr. Cralle, a committee, selected by the chair, from each delegation, consisting of J. Lyons, T. H. Ellis, R. K. Cralle, Rev. J. Early, R. G. Morris, S. M. Garland, Dr. J. B. Radford, Maj. E. Hamet, W. M. Burwell, R. E. Manson, R. J. Davis, W. T. Yancey, E. B. Withers, Capt. M. B. Nowlin, C. L. Mosby, Peter Clarke, G. C. Kent and P. S. Buckingham, was appointed to nominate officers for the convention.

After a short retirement, Mr. Cralle, on behalf of the committee, reported the following officers:

James Lyons, president. David Barnett, 1st vice-president, F. G. L. Buehring, 2d do., Thomas. Ellis, 3d do., Richard G. Morris, 4th do., Robert Allen, 5th do., Gordon C. Kent, 6th do. Wm. M. Blackford, Robert H. Glass, secretaries.

On motion, the following gentlemen were appointed a committee to report upon the business, which should engage the attention of the convention, viz:—Rev. Jno. Early, F. B. Deane, Jr., T. H. Ellis, C. Dimmock, Robt. Allen, W. M. Burwell, R. G. Morris, S. M. Garland, D. Barnett, J. B. Radford, M. B. Nowlin, E. B. Withers, G. C. Kent, Peter Clarke, R. K. Cralle and S. M. Thompson.

And on motion, to enable the committee to act, the convention took a recess until half-past three o'clock, P. M.

#### AFTERNOON SESSION.

The Rev. John Early, from the select committee, made a report, which, after some debate, in which Messrs. Burwell, Cralle, Early and some others partook, was, on motion, recommitted.

And the convention then adjourned until to-morrow morning, at 10 o'clock, A. M.

#### THURSDAY, 23D SEPTEMBER.

The convention met pursuant to adjournment, and was opened with prayer by the Rev. Dr. David S. Doggett.

On motion of Mr. Deane, B. F. Sackett, of Lynchburg, was admitted to a seat in the convention as alternate delegate from Jonesborough, Tenn., whereupon Mr. Sackett presented a communication from the citizens of Jonesborough, which was read and ordered to be printed.

*Jonesborough, Tenn., Sept. 16, 1847.*

*To the President of the Railroad Convention at Lynchburg, Virginia.*

At a meeting held in this place on the 28th day of August last, delegates were appointed to the railroad convention to assemble in Lynchburg on the 22d inst. It was expected and anxiously desired, that the delegates so appointed would attend; yet the undersigned regret the unforeseen circumstances which render it probable that none of our delegates will be present at the deliberations of your body. The undersigned, being desirous that the non-attendance of such delegation shall not be attributed to lukewarmness or indifference in reference to the project of connecting the Hiwassee railroad with the Richmond and Ohio railroad, have adopted this plan of addressing you, and through you the convention. We cannot refrain from expressing the opinion that the result of your deliberations will have an important bearing upon this contemplated improvement—a project of vital moment to the people of southwestern Virginia, as well as to the people of east Tennessee.

At a convention recently held at Greenville Tenn., composed of delegates from southwestern Virginia, and Tennessee, resolutions were adopted, asking the legislature of Tennessee for a railroad charter from Knoxville (the contemplated terminus of the Hiwassee railroad) to the Virginia line; and also asking the legislature of Virginia for a railroad charter from the Tennessee line through southwestern Virginia, to some point connecting with her railroads, and both states were asked to take 3-5ths of the capital stock. A committee was appointed by said convention from each state, charged with the duty of memorializing the legislatures of their respective states.

The undersigned would respectfully express their opinion that no section of the country is more eminently calculated to sustain a railroad than east Tennessee and southwestern Virginia. Both these sections abound in the natural elements of wealth, which want for their full development but the stimulus which would be imparted to every branch of

industry, by giving to us the markets which the construction of this improvement would open to our supplies and produce. Tennessee is now the third state in the Union in agricultural products; her mineral products, her mineral resources are unsurpassed by the richest in the world; her manufacturing are everything which water power can afford.—This, moreover, is the natural route for travel from the great commercial points of the north to those of the south; and the undersigned confidently believe that, with the completion of the Nashville and Chattanooga railroad, and a railroad connection between Knoxville and Lynchburg established, the ocean and river travel would be concentrated upon this line, and it would thus become the great thoroughfare between the north and south.

As to this project, all that the undersigned deem necessary for them to say, (and which has been their object in addressing your body) is that east Tennessee *has acted*, and the friends of the enterprise are anxiously awaiting the result of the deliberations of the convention: fully apprized of the influence which that result will exert upon our legislature.—We are confident that the importance of the project to southwestern Virginia, as well as to works of internal improvement, will command from the members of your body the earnest attention which your project merits.

*Signed by Sixty-four Gentlemen.*

Mr. Deane presented a letter from the Hon. James Hall, a delegate from the city of Cincinnati, explaining the causes of his failure to attend, which was read, as follows:

*Philadelphia, Sept. 18, 1847.*

FRANCIS B. DEANE, JR., Esq.

DEAR SIR: I regret extremely that I shall not be able to meet the convention at Lynchburg on the 22d inst, as I had intended and expected when I left home. Having previous engagements to fulfil at this place and New York, I am disappointed to find that these will delay me so long, as to prevent me from reaching Lynchburg in season for the meeting. I hope, however, that my absence will be excused, as I could do little else if present that to express the great interest and sympathy entertained by the citizens of Cincinnati, in regard to the truly magnificent enterprise which you have in contemplation—and that is already expressed by my appointment. A railroad from Richmond to the Ohio river, while it would be incalculably beneficial to us, as affording a direct avenue for our commercial and social intercourse with the Atlantic coast, would not be the less interesting as bringing us into more intimate connection with the great state to which we owe more than to any other, in reference to our political existence and institutions.

The project of a railroad from St. Louis to Cincinnati is now in agitation in the states immediately interested. It is understood that the city of St. Louis, in her corporate capacity, has appropriated a half a million of dollars to the work. In Indiana the undertaking is regarded with great favor, and will receive efficient support from her enterprising people. Liberal subscriptions have been taken up at Terre Haute, Indianapolis, and other places

on the route, and we have no doubt that the work will be immediately commenced, and rapidly prosecuted in that state. In Ohio, we are not less earnestly enlisted, and have already engaged with alacrity in the preliminary measures to make a section of the road extending from Cincinnati to Hamilton, a distance of 20 miles, which will no doubt be completed without delay. The necessary acts of incorporation have been obtained in Indiana and Ohio, except in reference to a few miles in the latter state, in regard to which there will be no difficulty. In Illinois the right of way has been refused except on condition that the western terminus of the road should be at Alton, in that state—a condition so unreasonable as to be inadmissible, but we entertain no doubt, that the legislature of Illinois will reconsider this condition, and in a matter so important and national, where in so many states are interested, and such large interests involved, will do what is just and patriotic. That road will be made without delay—not only to Cincinnati, but thence to the Ohio, where we shall be most happy to meet our fellow citizens of Virginia, and hail them as collaborators in a work which promises such inestimable blessings, in promoting the industry of our citizens, developing the resources of our respective states, and rivetting the bonds of our Union.

With sentiments of respect and esteem for yourself and the gentlemen acting with you, I am, dear sir, your very obedient servant,

JAMES HALL.

Mr. Barnett presented a communication from Lewis M. Provost, Jr., engineer of the southwestern turnpike, which was read, viz:

*Lafayette, Montgomery Co., Va.,*  
September 19, 1847.

To Messrs. David Barrett, John B. Radford and Edward Hammett.

GENTLEMEN: In compliance with your request, it gives me pleasure to occupy a few leisure moments, my multifarious duties will permit, in affording you such information as I possess, in relation to the best route to be pursued by a railroad from Lynchburg to the Ohio river; the plan upon which the work should be constructed, and the probable cost per mile.

1st. As to the best route to be pursued.

Two principal routes present themselves for consideration, which may be designated as the James River and Kanawha and the Roanoke and New River routes.

The James River and Kanawha line will require grades as high as 75 feet per mile, for a distance of upwards of four miles, to obtain which some extensive tunnels would be required, involving a very heavy expenditure, and from the generally rugged character of a large portion of the country, the line would necessarily be a very costly one, and at the same time materially interfere with the interests of another improvement, in which so large an amount of capital has been already invested: I refer to the James River and Kanawha canal.

The Roanoke and New River route I am more familiar with, and have no hesitation in saying that in the whole course of my pro-

cession, I have never seen a country affording greater facilities or inducements for the construction of a railroad. For many miles the line would follow the broad and fertile valley of the Roanoke, where the cost of grading would not exceed \$500 per mile, and passing through the valley of Elliott's creek, would attain the summit of the Allegheny mountains at a grade not exceeding 60 feet per mile. The surveys which have been from this point pursue the valley of Meadow creek and Little river to New river, but I have little doubt that a better one and one saving many miles in distance can be obtained by falling into the waters of Connelley's branch, and by that valley to New river.—So far as my observations of the valley of New river extends, there are no difficulties of any great moment to be encountered.—The cliffs which would be occasionally met with would involve some considerable expense but the generally favorable character of the ground would reduce the average cost of this portion of the line below that of railroads generally. One of the strongest arguments that can be adduced in favor of this route is that it would be a common stem, as far as New river, both for the Ohio and Tennessee lines, the latter of which is by no means inferior in importance to the former. It would be extended, beyond a doubt, on the part of Tennessee; would connect with the Georgia improvements by means of the Hiwassee road and would ultimately reach the Mississippi river at Memphis. By means of these lines the mineral and agricultural resources of a country, unsurpassed in wealth by any section of the Union, would be developed, and an amount of traffic drawn upon the road sufficient to pay a handsome profit on the investment, independently of any foreign trade or travel which would be obtained.

2d. As to the plan on which the work should be constructed, and the probable cost per mile.

Two great objects should be kept in view in the construction of such a work—*speed and safety; and fortunately with those we can combine economy.* The best road for obtaining these objects is a substantial H rail, weighing not less than 60 lbs. per yard, and altho' the first cost is greater than that of the imperfect plate rail in use in eastern Virginia, the annual saving in repairs and renewals of road and machinery would far more than counterbalance the additional outlay. A single track generally, with such portions of double track as would be necessary to ensure the safe passage of trains (which could always be located where the cost was at the minimum) would be most expedient in the first instance, and as the exigencies of the trade might require, additional portions of double track could be laid.

As to the cost of the road, I am aware that various estimates have been made, ranging from 10,000 to \$40,000 per mile, the first of which is under, and the last vastly over the truth. At the present prices of labor and provisions, it would not exceed \$16,000, including the machinery necessary for the efficient working of the road.

I believe that the people of the country ge-

nerally are becoming aware of the necessity of these improvements to their welfare, and, if the proper exertions were made, a very large amount of stock would be subscribed along the line, and in the adjacent counties. The end cannot be obtained by merely opening books of subscription in the different towns and waiting till they come forward with their subscriptions, but active and well qualified agents should be appointed, who would go to every man's house, explain the nature of the advantages he would derive from the work, and solicit his subscription in proportion to his means and the benefit received. In this way an incredible sum would soon be raised, and the prosecution of the enterprise rendered certain.

In conclusion, I would remark, that were the map of the Union laid before me, with liberty to select any lines of improvement, connecting the valley of the Mississippi with tide water, I could not choose any presenting so many and such varied advantages, as the Richmond and Ohio and Richmond and Tennessee railroad. As a means of national defence they would be of incalculable advantage to the Union; by developing the inexhaustible mineral wealth of Virginia, and giving free scope for the prosecution of agricultural enterprise, they would be invaluable to the commonwealth, and as an investment they would present the certainty of a speedy and rich return to the capitalist.

I have the honor to be, very respectfully, your obedient servant,

LEWIS M. PROVOST, JR.

Mr. Buckingham offered a letter from A. McCall, of Washington county, which was read, as follows:

*Saltille, Washington Co. Va.*  
September 17, 1847.

MR. P. S. BUCKINGHAM,

SIR: With the best railroad route, from the mouth of Little river to Emory and Henry college, your means of information are better than mine. The distance thence west to Chattanooga is about 300 miles, by a track most wonderfully adapted to railroad grading. Emory and Henry college is about 1800 feet above sea level, and the descent of nearly 1000 feet to Chattanooga is very gradual and well equated the entire distance. The mean slope will not vary much from three feet per mile, nor do I believe on the route I will indicate, that any cut will be required so deep as forty feet, and not half a dozen points for a few hundred yards, requiring that depth of cutting.

Emory and Henry is situated near the south base of Walker's mountain, through which a low water pass way leads to Saltville, eight miles northward at the north fork of Holston.

This branch of the Holston runs along the southern base of Clinch mountain, westward from Saltville 60 miles, by its valley road, to its confluence with the main Holston.

The railway track leaves the north fork 8 miles above the junction, and continues along Carter's and Stanley's valleys to Bean's station, 40 miles, and still, keeping near the south base of Clinch mountain, passes Blain's

station and along the Old Wilderness road, crosses the depressed Clinch hills, to Clinch river, six miles above Kingston, at the southern base of Walden's ridge of the Cumberland mountain.

From Kingston to the *Suck*, opposite Chattanooga, the distance along the level valley is about 100 miles, being in all 250 or 300 miles from Saltville to Chattanooga, where the Tennessee river breaks across the Cumberland mountain ranges, emerging into the plain country near Huntsville, Alabama, 100 miles by land from Chattanooga.

The entire track referred to lies on the north side of the Holston and Tennessee rivers, and crossing that river west of Huntsville, reaches Memphis over a level region.

Between the Tennessee river (there running northward) and the Mississippi river, a ridge of an elevation of 200 feet occurs, which is the only important elevation on the entire distance of 500 to 550 miles along the line designated from Saltville to Memphis. The track described lies in continuous valley depressions along the base of sandstone mountains, from Saltville to Huntsville, which are generally poor and uninhabited and have never been examined or surveyed by any engineer.

I have traversed and examined the entire distance, and was surprised that the Knoxville and Chattanooga railroad, not yet completed, was not laid off on the north, instead of the south side of the Tennessee river.

The Georgia railroad is now finished to a point 34 miles south of its terminus at Chattanooga, and from the latter place to Nashville a railroad will soon be made, passing through a district rich in stone, coal and iron.

Passing southward from Chattanooga, 160 miles along Will's valley, between the continuation of the Cumberland mountain ranges a level track for a railroad almost in a direct line, may be found, reaching to Wetumpka, or some other point of the Atlantic railroad, soon to be connected with the Mississippi at Vicksburg.

But placing out of view the important railroads crossing at Chattanooga and the Hiwassee road, from Chattanooga to Knoxville, it is our business in this quarter, to promote a connecting railroad from Knoxville along the southern base of Clinch mountain, 150 miles to Saltville, and the plaster banks, and thence through Mount Airy, by the rich iron and lead mines of Wythe Co., to the mouth of Little river, whence the railroad to Kanawha must diverge. The steep descent of 1500 feet from Little river to the Kanawha Salines can doubtless be overcome, but the profits arising upon the southwestern extension makes the latter first in order of completion.

The state of Tennessee has long felt the importance of extending the Hiwassee and Knoxville road towards Virginia.

But in completing the link between the Tennessee extension from Knoxville to Kingsport, near the Virginia line, and the James river and Kanawha road at Little river, not above 190 miles is required, the cost of which would be less than half the sum necessary to

make the road to the Ohio river over a like distance.

If from Little river, each road can receive equal support from state patronage, all should unite in finishing the eastern portion to that point. The expenditure upon the western roads ought to begin at their terminus and on the joint road the improvement should begin at Little river.

No friend of the railroad scheme of improvements should relax exertions to finish, as soon as practicable, the Macadamized road now in progress, from Little river to the Tennessee line.

Its uses are essential in an agricultural district like this, and cost a trifle when compared with the benefits it would extend to the construction of the projected road.

I cannot hesitate in believing that should Virginia complete a railroad from Lynchburg to Little river, that a western line from Chattanooga will speedily join with it.

I am well satisfied a railroad may be constructed from Chattanooga to Saltville, at less expense for grading, than would attend any other line of road in the Union, over a like distance. Along one side, for two hundred miles, coal lies within a mile of the track, at many points, and iron ore in immense amount near the line on the other side.

Exhaustless mines of lead and of native rock salt and gypsum, with many varieties of marble, would supply tonnage for the road.

The chief profit would however be derived by making the line the great thoroughfare for travel between the south and west and the east.

I have not time to state the points referred to, with the care to which they are entitled.

Respectfully yours, A. McCALL.

The Rev. J. Early, from the select committee, to which was recommended the report made last evening, presented an amended report, in the shape of resolutions, as follows:

1st. Resolved, That the time has arrived, when the people of Virginia must make a united and vigorous effort, to develop the resources of the State, and avail themselves of their natural advantages, by the adoption of a system of internal improvements, adequate to the purpose, or they must be content to hold a subordinate rank among the States of the Union.

2d. Resolved, That the experience of the age, both in Europe and America, has conclusively established the adequacy of railways to subserve the great interests of commerce, agriculture and manufactures.

3d. Resolved, That, in the opinion of this convention, no improvement could be constructed in Virginia, which would tend more to promote the prosperity of all and every portion of the State, than the great thoroughfare between the east and the west, proposed in the act of incorporation of the Richmond and Ohio railroad company, and that such an improvement, supported as it would be by the trade and travel of the west, would build up the seaports of the State and the inland towns on the route, and give a development to the agricultural and mineral resources of the commonwealth, which can only be conceived by witnessing the effect of similar improvements in our sister States.

4th. Resolved, That the explorations and surveys of the country are sufficient to satisfy us, that a connection between the Atlantic coast and the valley of the Ohio, by means of the Richmond and Ohio railroad, may be accomplished with as much facility, and at as little expense, as by any other work, which has been constructed or contemplated, and that there is no reason to doubt, that the proposed railway, if

promptly commenced, and prosecuted with energy, may be completed in five years.

5th. Resolved, That a petition should be presented to the legislature, asking an amendment to the charter of the Richmond and Ohio railroad, to enable that company to construct a lateral road to the south west of the main stem of the road, to such extent, within the limits of Virginia, as may be deemed necessary to accommodate that country.

6th. Resolved, That the construction of the proposed railroad would not only enable Virginia to resume her former position among the States of the Union; awaken the energies of her citizens; secure their prosperity and promote their progress; but it would also be a matter of great national interest and importance.

7th. Resolved, That it is expedient to address a memorial to the legislature, for the purpose of obtaining the aid of the State in the construction of the proposed railway, and that a committee of .... be appointed for the purpose of preparing and presenting such a memorial.

8th. Resolved, That it be recommended to the friends of the Richmond and Ohio railroad, to call meetings of the people in their respective towns and counties for the purpose of aiding and advocating the work and procuring subscribers.

9th. Resolved, That .... be, and are hereby, requested to go to Richmond at such time as may be appointed, during the next session of the legislature, to lay before that body all necessary information touching the road and generally to promote the objects of this convention.

10th. Resolved, That a committee of .... be appointed to prepare an address to the people of Virginia, with a view of promoting the interests of this improvement.

11th. Resolved, That the members of this convention will collect in their respective neighborhoods and forward to the chairman such subscriptions, as the friends of the work may be disposed to make, to defray the expenses of said committee, and such other charges as may be deemed necessary in promoting the objects for which it has been constituted.

Mr. Buckingham moved to amend the 5th resolution, by inserting, after the words "*main stem of the road*," the following words: "from some point on New river, in the county of Montgomery, to such extent within the limits of Virginia, as may be deemed necessary to accommodate that country."

This motion gave rise to a long and interesting discussion, in which Messrs. Buckingham, Lyons, Clarke and Early participated, but was rejected by a decisive vote.

The report of the committee was then adopted.

The president announced the following committees, called by the 7th, 9th and 10th resolutions viz:

To Prepare Memorial to the Legislature.—Rev. J. Early, F. B. Deane, Jr., Wm. H. McFarland, Jas. Garland, Richard G. Morris and C. Dimmock, and the convention added the name of the president.

To Attend the Legislature.—Thos. H. Ellis, Joseph R. Anderson, Peter Clarke, W. Blackwell, Benjamin R. Floyd, John Early, Geo. W. Summers, A. A. Chapman, Albert G. Pendleton, Wm. C. Irvine, and Col. M. Langhorne.

To Prepare an Address.—Robert J. Davis, J. K. Irving, Richard K. Cralle, Wm. M. Blackford, J. B. Radford, David Barnett, P. S. Buckingham, and the convention added the name of the president.

The following resolution was then offered and adopted.

Resolved, That one thousand copies of the proceedings of this convention, together with the correspondence elicited by the committee of arrangements, and such statistics and other information as may have been collected be published in pamphlet form, for general circulation; the cost of which shall be paid out of the funds to be collected, as provided by the resolution of the committee already adopted.

On motion of R. K. Cralle,

Resolved, That the thanks of this convention be presented to the president and secretaries, for the dignity, impartiality and ability, with which they have discharged the duties of their respective offices.

The convention then, after a short valedictory address from the president, adjourned.

JAMES LYONS, President.

WM. M. BLACKFORD, } Secretaries,  
ROBERT H. GLASS. }

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.  
Hamilton, July 30, 1847. 2m32

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**SPRING STEEL FOR LOCOMOTIVES.** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**RAILROAD IRON.—400 TONS ENGLISH,** 60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
63 Broad Street, New York.

**FOR SALE—300 TONS (10 MILES) FLAT** Bar Rail, in parcels or wholesale—section 2 1/2 inches wide by 1/2 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
Wilmington, Del.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
**SHIPPING & COMMISSION AGENTS**

FOR  
**PASSENGERS, SPECIE, GOODS, PARCELS, etc.**  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise,] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m **ROBERT GRACIE.**

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 232 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by JOHN A. ROEBLING, Civil Engineer, Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

2v191y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Ewing, Philadelphia; Wm. E. Collin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.** Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

**Cotton, Wool and Flax Machinery** of all descriptions and of the most improved patterns, style and workmanship.

**Mill gearing and Millwright work generally;** hydraulic and other presses; press screws; callen-lers; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,** Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 33f

## LAP-WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1725

28 Platt street, New York.

## RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address

J. M. HOWE,

Dec. 25, 17\*

Pres't. Mt. Savage Iron Works,

Maryland.

ENGINEERS' AND SURVEYERS'  
**INSTRUMENTS MADE BY**  
**EDMUND DRAPER,**  
Surviving partner of  
**STANCLIFFE & DRAPER.**

No 23 Pear street,  
1710 near Third,

below Walnut,  
Philadelphia.

THE SUBSCRIBER has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

West Troy, May 12, 1847.

ANDREW MENEELY.

17\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
121f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY Iron Company," Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents.  
1748 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 17,

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.		
	INCH.	LBS. OZ.	INCH.	LBS. OZ.	LBS.	INCH.		
11	4½	13 5	10	24 -	50	15-16		20
13	3½	9 3	8½	16 -	27	11-16		13½
14	3½	6 11	7½	12 8	17	9-16		10½

16	2½	4 3	6	8 8	10½	7-16		7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,  
Philadelphia, Pa.

Ja25

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power

**THE SUBSCRIBERS, AGENTS FOR**

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER, & CO.,**

59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**  
a45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents,**  
No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10½

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

**PETER COOPER** 17 Burling Slip.  
1y10 New York.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

No. 79 Water St., New York. 26f

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER &amp; MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28f

J. BALL &amp; CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m.; to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m., on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**LITTLE MIAMI RAILROAD.—OPEN**

TO SPRINGFIELD—Distance 84 miles—  
connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co.'s daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City via Urbana, Bellefontaine, Kenton, and the Mad river and lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	.....\$1 00
" " " Xenia	.....1 50
" " " Springfield	.....2 00
" " " Columbus	.....4 00
" " " Sandusky city	8 00

The Passenger trains run in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1 1/2 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston,

on the arrival of the boats from

Wilmington, N. C., in connection

with trains on the Georgia, and Western and Atlan-

tic Railroads—and by stage lines and steamers connects

with the Montgomery and West Point, and the

Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery

daily

Fare through from Charleston to Huntsville,

Decatur and Tuscumbia

The South Carolina Railroad Co. engage to receive

merchandise consigned to their order, and to

forward the same to any point on their road; and to

the different stations on the Georgia and Western

and Atlantic railroad; and to Montgomery, Ala., by

the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

THE WESTERN AND ATLANTIC

Railroad.—This Road is now in operation to

Oothcaloga, a distance of 80 miles, and connects

daily (Sundays excepted) with the Georgia Rail-

road.

From Kingston, on this road, there is a tri-weekly

line of stages, which leave on the arrival of the cars

on Tuesday, Thursday and Saturday, for Warren-

ton, Huntsville, Decatur and Tuscumbia, Alabama,

and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga

for Chattanooga, Jasper, Murfreesborough, Knox-

ville and Nashville, Tennessee.

This is the most expeditious route from the east to

any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846.

NEW YORK AND PHILADELPHIA RAIL-

road line—direct. Via Newark, New Brun-

wick, Princeton, Trenton,

and Bristol. (Through in

six hours.) Leaving New York daily from the foot

of Liberty street.

Morning line

Mail pilot line

The lines proceed direct to Bristol without change

of cars, and thence by the new steamer, "John Ste-

vens," to Philadelphia.

FARE BETWEEN NEW YORK & PHILA.

First class cars

Second class cars

Passengers will procure their Tickets at the office

foot of Liberty st., where a commodious steamboat

will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each

passenger in this line, and passengers are expressly

prohibited from taking anything as baggage but

their wearing apparel, which will be at the risk of

the owner.

Philadelphia Baggage-crates are conveyed from

city to city, without being opened by the way. Each

train is provided with a car, in which are apart-

ments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the

foot of Walnut st. at 9 a.m., and 4 1/2 p.m.

The lines for Baltimore leave Philadelphia daily,

except Sundays, at 8 a.m., 3 1/2 and 10 p.m., and Sun-

days only at 10 p.m.—being a continuation of the

line from New York.

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

1st class.—Boxes of Hats, Bonnets and Furniture per foot.....  
2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cans) Drugs, Confectionaries, Shovels, Spades, Seythes, Smiths' Bellows, Baskets, Tubes, Sifters, Brooms and other light articles, per 100 lbs.....  
3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheeser, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casks, or Crates of Crockery, Hardware, and other heavy articles not enumerated below.....  
4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Limestone Oil, per 100 lbs.....  
Per 100 lbs. Cotton.

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.: and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.

Chattanooga, Tenn., July 1, 1847.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, October 9, 1847.

**TO CONTRACTORS.—KENNEBEC AND PORTLAND RAILROAD.**—Proposals will be received at this office, until the 14th of October, for the Grading and Masonry of 14½ miles of this road, extending from Portland to North Yarmouth.

The line of road and the plans and profiles can be seen at this office, where any information in relation to the work can be obtained.

Persons unknown to the officers of the company, must accompany their bids with satisfactory evidence of their ability to complete the work.

GEORGE S. GREENE,  
Engineer K. & P. R. R.

Engineer's Office, K. & P. R. R.,

## The Iron Trade.

The London Mining Journal, of 28th August, quotes rails at £8 10 to £9, average—and Scotch pig at 67 to 68s., cash—with few transactions. Estimated there is 100,000 tons on hand.

Welsh and Staffordshire continue in good demand—and prices firm.

The pressure in the money market has, to a certain extent, interfered with the progress of the railway system, which, with the increase in the manufacture of railway iron in this country, has caused a decline in the price of the English article.

## Hudson River Railroad.

The following letter from Mr. Jervis, in reply to one asking information in relation to this important work under his charge, will be read with pleasure by those who have watched the progress of the enterprise. Many doubted the intention, and others the ability, of those who first moved in the matter, to carry it successfully through—and a larger number still doubt the ability of even the best railroad ever made, or to be made, to compete successfully with such steamboats, on such a river as the Hudson. We must admit that we were, for a long time, among those not sanguine of the early construction of the road—but never doubted the ability of the parties, nor of its eminent success, if constructed in a proper manner, which we are now quite convinced will be the case.

The opinions of Mr. Jervis, in relation to low fares, are entitled to consideration, as they have been adopted after long and careful investigation; and in opposition, we believe, to contrary opinions previously entertained. That they will be sustained by the result we do not entertain a doubt; and we believe, with him, that the Hudson river railroad will do much—if not "more than any other"—for the railroad enterprise. It—if any railroad in the country—will test the question, whether a good railroad can compete with the best steamboats, and steamboat navigation in the world, in carrying passengers; as the Reading railroad will test the question as to the ability of railroads to carry heavy freights, in competition with one of the best canals in the country.

OFFICE HUDSON RIVER RAILROAD, }  
New York, 13th Sept., 1847. }

DEAR SIR,—Your letter of 11th instant came to hand this morning.

With the exception of two or three small sections we have this road under contract, from the city to Break Neck Hill, a distance of 55 miles, which carries the line to the Northern verge of the Highlands. Many of the contractors have commenced operations, and we shall soon have an active and vigorous progress of this part of the work—a work that is to do more for railroad enterprise than any yet undertaken in this country. We are to compete with a first rate steamboat navigation, which it is obvious we could not succeed against if we made an ordinary road; but with the easy grades, and the road we design to make, I have no fears of entire success; that is, so far as to make a diversion sufficient to sustain the road. We shall move

smooth and easy, at 30 to 40 miles per hour, and at the low fare gauge; it will be wonderful if we do not have passengers notwithstanding all the inducements steamboats can offer.

We carry a solid embankment, protected by a heavy river wall, where the line runs below high water mark, in the river, making bridges no further than is necessary to freely pass the water of streams, and allow free circulation of tide in the bays. Our total length of bridging, on the line now under contract, is less than 5000 feet.

Our line has been carefully located, and quantities computed from actual measurement; and by the contract it appears we shall get the work done within the estimate.

After much examination and reflection on this subject, I am fully persuaded, that on all important thoroughfares, through populous districts, the low fare system can be successfully sustained, on well made, and well conducted railroads, and afford good profits on the investments. We intend to demonstrate this on the Hudson River Road, and by doing so we shall confer a benefit on the public.

Respectfully, Your Obedient Servant,  
JOHN B. JERVIS.

## Telegraphs in England.

"The pipes," says the Chronicle, "opening the communication of the electric telegraph between Lothbury and the south of the metropolis were laid down on the 4th inst.

"The company, it is said, will open direct lines of communication to fifty of the principal towns within three months."

## Illinois and Michigan Canal.

This great work is approaching to completion.—The Chicago Journal says: "A gentleman connected with the work upon the Kankakee feeder assures us that it will be completed by the 15th of November. It was feared this portion of the work would be the last to be finished, but it is now as much advanced as any portion of the heavy work upon the line. About 300 feet of masonry per day will soon complete it, which is the rate at which it progresses. The balance of the machinery for pumping water upon the summit level, arrived yesterday from Erie in the Susquehannah. It is manufactured by Col. W. J. Totten, of Pittsburg, who superintends putting it in place here. The machinery is capable of elevating 10,000 cubic feet of water per minute, and will be ready for use in about 60 days. A drive to

Canal port a few days since—the point where the canal intersects the river—convinced us that the works in progress there, were much nearer completion than we had anticipated."

#### Schuylkill Coal Trade.

The following reports show that 1,218,150 tons of coal have been sent from the Schuylkill region this year—which is nearly equal to the entire amount of last year, with twelve weeks remaining yet for operations—in which they will probably get down about 300,000—making in all 1,550,000 tons for the year—showing an increase of about 25 per cent. on the amount from this region last year—and producing a return to those who have been engaged in getting it to market, of at least \$6,000,000!! while the coal from the other regions, and the iron, of Pennsylvania will produce at least as much more—or \$12,000,000 for her minerals, in addition to the products of the soil, which are unsurpassed by any State in the Union. With such resources, and the completion of her public works, Pennsylvania must become one of the most wealthy States in the Union.

#### Connection of the St. Lawrence with Lake Champlain.

We learn from the Montreal Herald that the project for a canal from Caughnawaga to St. Johns has been received with so much favor by the Provincial government, that Mr. Barrett, the engineer connected with the board of works, has been directed to make a preliminary survey. The result of this examination of the ground is most favorable. It appears that the distance between the St. Lawrence navigation and that of Lake Champlain does not exceed 20 miles, and that it would be impossible to find any piece of land which offers so many facilities for such an undertaking. Its utility admits of no doubt; for it is manifest that this would secure to the St. Lawrence the whole trade of the west with New York. We are informed that plans and estimates for this work are now in preparation; and that should the government decline to take the subject up, an immediate attempt will be made to secure the necessary funds through the capitalists of the State of New York.

#### Magnetic Telegraph.

The magnetic telegraph from Buffalo to Milwaukee is proceeding rapidly to completion. The contractor, Mr. Cornell, has just made a contract for the wire. It is the best quality English No. 9, and weighs 350 pounds to the mile. We saw a piece of it twisted into various shapes without a fracture.—Mr. Cornell is also building the Troy and Montreal

line, via Bennington, Rutland, Vergennes, St. Albans and St. Johns, and will have it completed in sixty days. This line will save the fluid much labor, as it now must go round by the way of Buffalo.

#### Fall River Railroad.

The business of this road is increasing beyond the most sanguine expectations of its friends. The following are the receipts for three months, ending August 31st:

June.....	\$11,000
July.....	15,000
August.....	16,599
	\$42,599

These earnings are on a capital of one million only, and the road is free from debt.

#### Crampton's Narrow Gauge Engine, With Large Driving Wheels and Low Boiler.

The Railway Chronicle, of September 11th, gives three views—a side, front and rear—of this remarkable engine, the "Namur," of which we have spoken more than once. By referring to the Journal of 22d May last, our readers will find a plan and specification of one of Crampton's engines with high drivers, and low boiler, but in that one the driving wheels are in the centre; in this, they are behind—the axle of the drivers being behind the boiler.

"This engine," says the Chronicle, "has been said by high authorities, on the London and North Western, to present the complete solution of the question of speed, as between the narrow and broad gauges, being run steadily smoothly, and safely, 75 miles an hour on that line." If this be so, we shall hear more of them, as it is said that "two of them have already been built, and several more of them ordered."

#### Telegraph.

"An electric telegraph is in active preparation along the railway from Vienna to Prague. When completed, every locomotive engine is to be furnished with a small electric apparatus, by the aid of which and of a wire it can be put into communication with the telegraph, and thus announce to every station the events necessary to be known."

This is an excellent idea. It is in accordance with our views in relation to the erection of telegraph lines along the lines of railroads, as they can be more readily kept in repair and guarded, and can be more useful to community.

#### Influences of Railways.

The following article, under the head of "Promotion of Internal Relations," will apply as well to this country as to Europe. They will serve to make us familiar with important regions of country, of which we should know very little without them.—Light and intelligence will, by them, be carried into many a dark corner.

The Berlin correspondent of the Morning Post says: "The international relations grow from day to day more close and lively by means of the railways. Never before have we seen so many inhabitants of the capital of Austria among us as now.—A few days ago we read in one of our newspapers that all the managers of the whole chain of railways between Vienna and Hamburg had been invited to favor with their presence the opening [on the 1st of September] of the Hungarian central line from Pesth to Szolnock. Ten years back the number of the people of Berlin or Hamburg who had visited the interior of Hungary, was exceedingly small. Also in many other respects do the railways act as connecting links between the Austrian and North German elements. The tariff centner, or cwt., of 100 lbs., has thus now also been adopted as a general mea-

sure along the Ferdinand north line, and will probably assume the same character also on the other Austrian railways. The weights and measures will no doubt be followed by the coins."

#### Railway Traffic.

From official returns, it appears that the amount of traffic for the week ending Sept. 18th, on upwards of 3,132 miles of railway, was £210,147, thus accounted for: £117,846 for the conveyance of passengers only, £46,358 for the carriage of goods, and a remainder of £45,943 for passengers and goods together, not respectively apportioned; being an increase of £35,860 over the corresponding week of last year, when the mileage was about 2,925. This increase is not in proportion to the extension of the system.

#### Erie Canal Enlargement Resumed.

Our readers will rejoice to learn, says the Niagara Courier of 15th ult., that the arrangements preparatory to commencing the second tier of enlarged locks at this place, are now complete, and that on Monday last the laying of stone commenced. William Buell, Jr., the contractor, has made arrangements for the prosecution of the work in the most vigorous manner, and the high praise which has been awarded to him, for his intelligent and efficient management, upon late and important works on the Welland canal, affords a sure guarantee that this much needed work will be completed at the earliest possible day.

#### Railway Gossip.

The Railway Chronicle says that Mr. Crampton's new locomotive, the "London," which had been recently laid up for alterations, is again at work, effecting nearly a mile a minute with heavy trains; and that Lady Davenport is considered a *rara avis* among land owners. It is said that her ladyship is willing to forego for five years the payment for the land required by the Manchester and North Staffordshire.

The York and North Midland railway has, within twelve years from its formation, increased from 23 to 310 miles in length.

Messrs. Newall, of Gateshead, have made an iron rope for the Edinburg and Glasgow of the length of 4,660 yards. It weighs 20 tons 5 cwt., and is worth £1,330. A hemp rope would have been dearer and heavier.

It is said that the employees on working railways form already a considerable army. A return just issued shows that there are 47,218 officers and men employed on seventy-four railways in England and Ireland opened for traffic, the gross length of which is 3,305 miles, having 1,040 stations. There can be no doubt that the existence of a troupe of men so orderly and well trained as are railway officers, is a great political advantage.

The Chronicle says that the average fare paid by each traveller on railways during the year ending June, 1846, appears to have been two shillings and twopence. Such is the result shown by a parliamentary return, exhibiting the number of travellers on 63 railways in the United Kingdom during that period, and the amount of receipts from each class. The number of passengers who travelled by first class was 6,160,354; by second class, 16,931,065; by third class, 14,559,515; by parliamentary class, 3,946,923; by mixed, 2,193,126—total, 43,790,963. The amount of receipts from passengers was: first class, £1,661,897 19s. 10d.; second class, £1,907,946 19s. 11d.; third class, £738,474 4s. 11d.; parliamentary class, £293,732 7s.; mixed, £93,164—£4,795,215 11s. 8d. The amount received for

goods, cattle, etc., was £3,741,200 16s. 6d. Grand total, £7,466,416 8s. 0d. The inference from these data is, that the average distance travelled by each person must have been somewhere between 20 and 13 miles, and cannot have been so much as 26 miles—a result which shows how considerable the short local traffic must be.

#### Menai Straits—Tubular Bridge.

We published in the Journal of September 4th, a letter of General Pasley, addressed to the London Times, in which he descants somewhat severely upon the various "projects" proposed by Mr. Robert Stephenson, for passing the Chester and Hollyhead railway over the Menai Straits. Since the publication of General Pasley's letter, there has been a meeting of the Chester and Hollyhead railway company, at which Mr. Stephenson replied to the General in the following terms. We quote the *Railway Record's* report:

"General Pasley makes only a statement, or rather gives a detail of conversations which took place between us relative to the principle of the use of iron tube bridges. General Pasley states, that at first he approved of the principle adopted by me, and there is not in his letter one paragraph to condemn that principle—nay, he distinctly repeats that he approves of the principle. What he complains of is the mode of erecting the tube. Now, gentlemen, there are only two or three persons who know the facts connected with the mode proposed, and General Pasley cannot possibly be in possession of any information which can at all justify his prediction. The original plan was to use chains to raise the tube to a level with the platform of the railway, which chains could be removed when the tube was fixed. Afterwards, we altered the mode of raising the tube; and it is only to this mode about which General Pasley cannot know anything—for, as I have said, it has been confided only to two or three persons—that objection is taken. I believe any apprehensions that may be entertained are of a very vague character, and that it is mainly the novelty of the plan which gives rise to such apprehensions. I believe the objections have nothing in them; the plan is only an application on a gigantic scale of an old principle.

"I beg to say, gentlemen, that they have created no apprehension whatever in my mind; they have not altered my convictions in the slightest degree: and though, as in all great works, difficulties doubtless will arise in the course of their execution, these difficulties, I am satisfied, will only be such as will suggest the remedy as they occur. I believe nothing will occur which we shall not be able to correct. I shall myself be on the spot; and I repeat, that though I never knew any great work of any kind in which difficulties have not arisen, I entertain no doubt that in this case they will be readily surmounted. I beg, therefore, that the proprietors will dismiss all apprehensions on this point from their minds. The scheme involved long and experimental investigations, exceeding anything that had ever taken place before; but I felt that a large expense was fully justified to test and settle the details of the bridge. I believe we have so settled the

matter; and I have reason to know that the most eminent engineers and mathematicians approve of the principle.

Mr. HENMAN had understood General Pasley's objection to be, that Mr. Stephenson now intended to abandon the suspension principle which he had originally fixed upon. Now, he would be glad to know if Mr. Stephenson was of opinion that the tube, being of so large a span as 450 feet, would be able to bear the trains, and withstand the vibration, without support from chains at intermediate points.

Mr. STEPHENSON.—I wish it to be distinctly understood that I never designed the chains should form an essential part of the permanent structure; they were originally proposed, not for supporting the tube, but for raising it. As we proceeded, I found that, by increasing the weight and size—or rather, I should say, the weight only, for the size has never been altered—we could dispense with the chains altogether. I believe that it may be looked upon as fully settled, that, as respects the strength of the bridge, the chains would rather be a deterioration than otherwise. As regards vibration, there are certainly various opinions; but, for my own part, I think that no vibration at all will be felt. My reason is, the relative ratio of the weights of the tube and the trains. Take, for instance, a train of even 100 tons, then, as the tube is to be 1,200 tons weight, I ask whether, with such relative weights, the tube is likely to be thrown into vibration? I say it is impossible. If the ratio of weights were reversed,—if, for instance, the train should be 1,200, and the tube 100, such vibration would, undoubtedly, arise. I believe that the tube will be as firm as a rock—that it will suffer no vibration at all; at least, not more than everything does over which a train passes.

We quote the following description of this stupendous work, in its present state of progress, from the letter of a correspondent of the *Manchester Examiner*:

"If we suppose ourselves stationed in a boat in the middle of the Menai Straits, a few hundred yards distant from the new bridge on the south side, and suppose it finished, we shall see a wonder of the world of this kind. First, there is the middle pier rising out of the water, founded on the Britannia rock, after which the bridge is named. This rock can be seen at low water. The breadth of this pier is 62 feet by 53 feet and a quarter of an inch. The blocks of stone are 7 and 8 feet long by 3 and 4 feet in breadth and deepness, and they rise, stone upon stone, until the pier is 230 feet high. At the distance of 460 feet on each side of this centre pier there rise, near the water's edge, two other piers of the same gigantic breadth and height; while, on each side of these two piers, at the distance of 250 feet, there rise two walls. Continuing outwards, the wall on our right hand, on the Carnarvon shore, does not extend its ponderous bulk far back, for the land is high and bold, and the railway comes along its elevated brow, and at once lays hold of the bridge. But on our left hand, which is the Anglesea shore, the wall is the forehead and end of a mighty em-

bankment, on which the railway is raised to the level of the bridge. There, then, are the four spaces before us, across which, in the iron tubes, the railway is laid, namely, two spaces on each side of the centre pier, of 400 feet each (let the reader measure 460 feet on a street or on a road, and he will wonder at the vastness of this structure;) and two more spaces of 250 feet respectively, at each end. The tubes are eight in number, each of them 30 feet on the exterior side, and 27 feet high in the interior. Each is 14 feet wide, and they are laid in couples parallel to each other. In the whole, with the breadth of the piers and the landward buildings, the length of the bridge is one-third of a mile. In height the three piers are, as already said, 230 feet. Measuring from low water mark to the bottom of the tubes, the height is 130 feet, the tubes being thirty feet on the side, and the pier 70 feet above their upper surface. As ornaments to the two walls which rise upon each shore, are four lions, two at each end of the bridge. The lions contain about 8,000 cubic feet of stone. They lie couched, and yet the height of each is 12 feet; the greatest breadth across the body is nine feet, the length 25 feet, the breadth of each paw two feet four inches. The tubes are made of plates of iron of various thicknesses, rivetted together. The iron increases in thickness as we proceed towards the centre. The roofs of the tubes are formed of cells, and also the floors. These cells are formed of iron plates set on edge, the cells of the roof being within a fraction of one foot nine inches square, and those of the floor being one foot nine inches wide, and two feet three inches deep. The rails on which the trains run, are laid on the cells of the floor. The flat bottom, the two upright sides, and the flat roof of each tube are formed of plates, the thinnest of which is a quarter of an inch, and the thickest three quarters of an inch. The weight of each of the four long tubes will be about 1,300 tons; the weight of each of the four short ones, about 600 tons. In the whole, there will be at least 7,600 tons of iron used. The masonry was contracted for by B. J. Nowell & Co., at 130,000l.; but, from alterations in the plans, it will cost 200,000l. They expect to finish the masonry by August, 1848. It will contain 1,500,000 cubic feet of stone."

#### Railway Service under Existing Circumstances.

We find the following remarks on this subject in the London Railway Chronicle, of 18th September; and, as they relate to an important matter, deserving of constant and watchful attention in this country, as well as elsewhere, we give them a place in the Journal, and shall endeavor to do the same by those which may follow from the able editor of that excellent paper on the subject.

It is well known that we are, and have been, the advocate of "low fares"—but only such low fares as would, by inducing an increase of business, increase the receipts, and thus be the means of enhancing the value of railway investments; and here is the difficult question to settle, viz: what are those rates? The answer can only be given, as we contend, after a series of experiments, instituted in accordance with the circumstances under which they are made. A rate of fare and charge which would

ensure success on the roads in Massachusetts, would not accomplish the same object in Virginia—so also what would give rich returns between populous cities will not pay expenses through sparsely populated regions, and between small towns. It is a matter, we believe, which requires the most thorough investigation, and judicious experiments by the engineers and directors, who ought to be gentlemen of intelligence, who are willing to yield pre-conceived opinions—and perhaps prejudice—upon good authority, or practical experience.

The editor says, "From the half-yearly accounts of all the great companies—with the exception of the Midland and Yorkshire system of lines under Mr. Hudson's management—one general deduction, it appears, may be pretty fairly drawn, viz: that the scale of passenger fares has already been lowered to the extreme point at which the work can be profitably done, while the other working arrangements subsist as at present. This observation may suggest the expediency of viewing the probable course of future affairs attentively, and reviewing more than one class of practical details, for the purpose of seeing whether something may not be attempted to secure the valuable interests of the owners against any injudicious effect from what has already been imposed, or may hereafter be laid upon them. From this inquiry it will be proper to exclude all reference to temporary circumstances, or to any cases of an exceptional kind. The proportion of net receipt to expense, for instance, has been effected on many lines by causes independent of the mere rates of charge: there have been serious casual checks to the ordinary flow of traffic—there may have been expenses that good management might have avoided, and may hereafter prevent. These are altogether foreign to the discussions we speak of. Nor will the conditions of a railway like the Great Western, with its peculiar system, both of fares and of structure; supply any materials for the general question, which is concerned with the universal tendencies that have affected or are likely to affect the prevailing national system.

"Setting all casual matter then aside, these points, we think, may be distinguished on the ground already cleared;—1st. That the current business on the main lines, at existing rates, is greatly reduced in its profitable income. 2ndly. That the business on the additional branches, when they are completed, is not likely to return a rate of profit equal to what the principal trunks may still earn;—while the proportion of the accessory to the chief lines is increasing, so that the supplement may soon become greater, in mere lineal extent, than the original body. 3dly. That in the article of charges no alteration of any consequence, in favor of higher rates, could be prudently attempted now; and that the efforts of the public, seconded by the State, will be continually applied to bring them still lower hereafter. These are positions to the bearing of which it behooves all concerned in railway management to be attentive; and they lead, we think, to conclusions of a practical kind, that deserve consideration for the sake of all owners of railway property.

"We propose, therefore, to examine next week what those conclusions are; and to

what extent it may be proper and convenient to act upon them in the ordering and working of the current traffic on the railways of this kingdom under existing circumstances."

#### SARDINIAN RAILWAYS.

It would seem that the railway fever has reached every government in Europe, and we shall expect soon to hear that the *Sultan* has given orders for the construction of railways within his dominions.

The following article, which we find in the *Chronicle*, speaks of the works projected in Sardinia—and of tunnelling the mountains, as though it were a mere trifle. It says:

"The Sardinian railways will be composed of three great trunk or principal lines, diverging from the central point, Alexandria. The following account is furnished by the *Morning Herald*. The first will pass by way of Genoa the Superb, across the Apennines;—the second by way of Turin, to Asli, world-renowned for its famous white wine—the proper accompaniment to the small, sweet, plump oyster of Genoa. The third will pass by Valenza and Novarra to lake Maggiore. On the first named line, workmen have been employed on all the points for a considerable time, and the tunnel *dei Gioghi*, which is to pierce through the Apennines for a length of 3,000 metres, and which it is said will cost 8,000,000, is going on so vigorously that it is reported it will be finished in 1850. During the severe winter which we have just passed, from 20,000 to 25,000 workmen were employed on this line, for the space of four or five months. On the third line—namely, that from Alexandria to lake Maggiore, workshops and smitheries are open in the neighborhood of Novarra; and the magnificent viaduct of Valenza, over the Po, which is to cost 4,000,000, has been already commenced. Complete surveys have also been made for the Turin line to France, by way of Savoy. The position of the tunnel through Mont Cenis is already determined on. On the Italian side it will commence above Exilles, a few leagues from Suza, and open out on the other side, on the slope opposite the village of Modene, in that sweet valley near St. Jean de Maurienne. Let the reader reflect with pride, that a tunnel of 10,000 metres, under the Mont Cenis—a work, the mention of which fifteen years ago, would be received with a smile of incredulity—is destined to be accomplished in the era in which we live.—Yet are not our boastings very vain and very empty? for after all, as the wise man says, there is nothing new under the sun. In the Roman States a tunnel or subterranean passage for an aqueduct existed, as is truly stated by a writer in the *Revue des Deux Mondes*, from one side of the Apennines to the other more than twelve centuries ago; and why should not modern science be enabled to achieve for locomotive engines and their passengers that right divine of way which the old Romans sought and found for water?—The chief engineer of the Sardinian government has invented a machine for the purpose of perforating the mountain, and it is not to be supposed that the influx of water will present anything like the obstacles Mr. Brunel had to encounter in the Thames tunnel. The

easy and prosperous state of the finances of Sardinia will enable the State to accomplish with ease these gigantic and important works and several others of minor interest, to which it is not necessary more especially to refer. The cardinal and most pressing task of Piedmont is, however, the finishing of the great line of communication between Genoa and lake Maggiore, and to this her chiefest energies should continue to be directed. Before such a work the paltry toll gates, the petty and vexatious *octrois*, *peages*, *douanes*, and *doganieri* of Italy must fall; and probably before 1850, we shall see the day when an English gentleman shall cross the Alps and Apennines, and pass the Po and the lazy Brenta, described by Ariosto as

.... un fiume

Che verso il vicin mar cheto ai muove,  
without once unpacking his travelling bag."

#### RECIPROCAL RELATIONS OF RAILWAYS AND THE RAILWAY PRESS.

We often find, in the *Railway Chronicle*, views put forth exceedingly appropriate and just—and although designed for another country, we consider them equally appropriate here, and therefore give them to our readers that they may apply them if they are of our opinion.

There can be little doubt but that the system is indebted to the press, and therefore the press ought to be liberally sustained by the system.

"There are certain reciprocal relations between railways and the railway press which, as recent events prove, are not sufficiently understood or satisfactorily carried out. At the South Eastern meeting, Mr. Macgregor very properly acknowledged the great service which the railway press rendered in opposing and successfully defeating the attack on railways threatened by the Strutt bill. At the same meeting, it came out, in answer to a shareholder, that under the impression of saving a small sum, the usual practice of advertising the meetings in the railway press had not been followed on this occasion. The excuse given was that notices had been sent by post to all the proprietors. As a matter of mere convenience to shareholders, it is clear that an advertisement is far better than a posted letter. An advertisement stands as a record for all time. Besides it certainly is the duty of railways, in return for the support and good which they undoubtedly receive from the railway press, to make it the interest of the proprietors to support that press; and the habit of recording all matters of fact in the press would have a wholesome tendency in inducing shareholders to consult the press for information. But there is another view which may be fairly insisted on. The only legitimate return which railways can make to their advocates and supporters is by Advertising—and railways are bound to do this. In the time of the mania, railways for their own purposes advertised freely enough, but when economy becomes important, advertising is narrowed or neglected, though its importance is quite as great for all legitimate railway purposes. Our readers will have remarked that recently a small proportion only of the numerous half yearly meetings, or the resolutions passed at meetings, have been ad-

advertised in any of the railway papers. We contend that these advertisements are the right of the railway press, and that no plea of economy justifies the withholding them. If the railway press saved, as it did, railways from the Strutt bill, it savors a little of ungrateful neglect not to make the only return which railway companies have it in their power to make—namely by *Advertising*."

**SPEED, COMPETITION, THE FOUR RAIL SYSTEM, AND THE TRUE PRINCIPLES OF GOODS AND COAL TRAFFIC.**  
*Views of Mr. Stevenson, as given before the House of Commons.*

The following extracts from Mr. Stevenson's opinions, given before a committee of the House of Commons—are taken from the Railway Chronicle. They appear not to have been before published—and they will probably be interesting to many of our readers. We give them a place in the Journal.

**The Four-rail System, Economy.**—In consequence of our fixed establishment we shall be able to carry the additional traffic we obtain cheaper than any other company can do. At present, as you converge towards London, the trains become more numerous, and when any of them are not in time they give rise to great disorder; not because the railway is incapable of carrying them when they keep their time regularly—for the London and Birmingham are capable of accommodating three times the amount of their present traffic, provided absolute punctuality is insured. More towards London the value of punctuality begins to tell most, and we want more lines.—A loop line from Tring to Banbury (the Buckinghamshire, since passed) would accommodate local traffic, and could also be made subservient to heavy traffic moving at slow rates. Four lines of rails from London to Tring would receive and divide the great tide of traffic flowing towards the metropolis (at present flowing on two lines of rail only) and by enabling us to serve the public better attract more traffic to us.

**Competition.**—Looking at the past, we may expect for some time to come that the hostile companies will go on devouring each other, though I hold the opinion very strongly that permanent competition is impossible. The object of companies who are in competition in laying out lines is generally for the purpose of maintaining the ground, in order that when the time does arrive for adjusting their differences, they may not be trampled on by their neighbors. I have the strongest possible opinion that perpetual competition is impossible, and that after the country is occupied there will be an adjustment. The Gt. Western are great preachers of competition, yet it is within my own knowledge that treaties have been going on between them and the London and South Western, of which a territorial division has been the basis!

**Quick and Slow Traffic (London and North Western).**—At present we are obliged to force on our goods train to make room for our passenger trains. The cost of conveying goods is augmented in consequence of that speed.—The public will never get the full advantage of railways until they can separate the slow traffic more or less from the quick traffic.—Up to a certain extent the mixture does not

add to the expense of conveyance, but when the mixture becomes very great, or the income of the railway is derived as much from goods as from passengers, then, in order to convey goods more economically, it becomes desirable to convey them at a speed of, say, from 15 to 18 miles an hour, coals at a speed not exceeding 15 miles an hour, for it is impossible to convey them at 1d. or 3d. per ton per mile, if they are to be hurried along at 25 or 30 miles an hour; the cost and the wear and tear are too great, besides coal is damaged very much by velocity. The clogging of the London and Birmingham line referred to has arisen from the tolls being very much lowered. Many persons thought that the reduction of tolls would not increase our traffic. Now, I held a different opinion. I always thought that by reducing fares on railways, especially the charges on goods, they would become great instruments of conveyance for the heavy class of articles—and so it turned out. So that a great increase came upon us suddenly, without our having either wagons or engines adequate for the increase.

**Wear and Tear on Broad and Narrow Gauge.**—Q. Is there no difference of pressure on the same weight of engine at the same speed on the broad and narrow gauge? A. None; the crushing weight is precisely the same, or rather the crushing effect of the wide gauge is greater at the curves than on the narrow gauge. If there was any difference in the tendency of the heavy weights to crush the rails, it would tell against the wide gauge at curves, because the wheels are keyed on the axle, and they consequently move round with the same velocity, and when the engine is going round a sharp curve there is a greater distance to go round upon the outside, so the inside wheel has to slide a little back, and the outside wheel has to slide a little forward; and, inasmuch as the difference of gauge increases the amount of sliding, the heavy weights will crush the rails more in the one case than in the other, but in a perfectly straight line the crushing is equal. Q. Is the rail stronger on the broad or the narrow?—A. The rails are laid by Mr. Brunel on longitudinal timbers. He takes the strength of the timber as well as the iron.—In the usual mode of constructing the narrow gauge you do not use the longitudinal timber, but you lay heavier rails instead. You get the bearing strength entirely on the rails in the one case, and in the other case partly on the timber.

**Speed.**—We are now in possession of speed that no permanent way in existence, broad or narrow, will be able to stand long. The wear and tear of the rails has been, in my opinion, nearly as the square of the speed.—If it were perfect machinery in every respect, the wear and tear arising from concussions, ought to be exactly as the square of the speed, and I presume it ought to be directly as an engine weighing double the number of tons would cause double the amount of crushing. Indeed, I know that speed is the great trial of our present permanent roads. The proof is that we have been obliged to strengthen them about 16 or 18 pounds per yard, and

now there are some of about 90 pounds.—This increase of speed, the weight remaining the same, is a direct and large sacrifice of the profits of the company, which has operated, and is now operating with the London and Birmingham, and has led them to consider the propriety of duplicating the lines where they are compelled to run the heavy trains so quickly—that is between Tring and London. The interest of the capital they are about to expend to duplicate the line will be about £40,000 a year, the cost will be about £780,000.

**The Origin of the Oxford, Worcester and Wolverhampton.**—Is it a fact that this district applied to the London and Birmingham for accommodation and was refused, and was it in consequence of that refusal that the Oxford, Worcester and Wolverhampton line was originally projected? A. That, perhaps, is a rather harsh mode of representing it. But some of the London and Birmingham board entertained a notion at that time that railways were not really fitted for the conveyance of heavy goods, and they did not seek to obtain the traffic which the country demanded; and then again their accounts were kept in such a way as to make it appear that they lost money by the conveyance of goods. This was done by charging the goods with a portion of fixed expenses, which would have been necessary under any circumstances even for conveying passengers. Therefore when you debit the goods department with its proportion of the fixed establishment of the railway, then it does appear a loss to carry goods.—There may be one or two of the board now left who entertain their old opinions, but I know the management and system has undergone a complete revolution in that respect. I have always entertained the opinion that they ought to come down with their fares and carry heavy goods, and have urged it on the board. But I do not move out of the engineering department of the company. *I think that railways as instruments for the carriage of heavy goods, have not reached half their perfection or extent, and will not until we are permitted to separate the fast and slow trains.* If we convey heavy goods at 15 miles an hour, I believe it will reduce the cost of conveyance to considerably lower than one-half of what it is now; so that a large quantity of coal may come to London from the Midland districts. At present it costs us three farthings per ton per mile. In the north at Stockton and Darlington, where they convey the coal at nine miles an hour, every charge is included, and they carry it at one-half penny a ton per mile. The breakage of coal is so much increased by rapidity of movement, that it becomes impossible to move ordinary coal wagons when they are on any of the main lines without springs. The speed brakes the coal all to pieces. Experience has shown that the multiplication of railroads facilitates and creates much greater traffic than was anticipated. They reach on each other. That is one of the most remarkable features in the extension of the railroad system—the extraordinary reciprocation of traffic. If by the multiplication of railroads,

and the adoption of economical modes of transit, you can reduce the price of coal, the demand for the article in London would be most prodigious, and in the country it would be very large. There are many agricultural counties where they do not know what coal is now.

**Report on the Preliminary Surveys for the Milledgeville and Gordon Railroad.**  
Continued from page 631.

The estimates of cost are as follows:

**Section First.—Earth Work.**

Excavation ..... 29,343 c. y. at 16, \$4,694 88  
Embankment ..... 64,798 " " "

Excess of embankment, 35,455 " at 12, 4,254 60

**Masonry.**

Mortared ..... none.  
Dry ..... 89 cub. yds. at \$3, 267 00

Dry ..... 114 " at \$3, 342 00

**Bridging.**

Lattice ..... 150 ft. run at \$15, 2,250 00

\$15,732 08

Cost of grading, masonry, and bridging, \$54,042 29

The quantity of excavation in cubic yards, is ..... 217,493

The quantity of embankment ..... 278,883

Total ..... 496,376

**ESTIMATE FOR ONE MILE OF SUPERSTRUCTURE.**

13,360 ft. b. m. in stringers, at \$7 per m. .... \$443 52

60 cross ties, at 20 cts. .... 120 00

36 tons of iron, at \$70 ..... 2,520 00

2,000 lbs. of splicing plates, at 4 cts. .... 80 00

1,487 lbs. spikes, at 5 cts. .... 74 35

Laying superstructure ..... 450 00

Filling track ..... 50 00

\$3,749 87

**COST OF ROAD.**

Grading, masonry, and bridging ..... \$54,042 29

Clearing and grubbing ..... 1,550 00

Right of way ..... 2,000 00

Grading & superstructure for 1 turn out, 1,000 00

One warehouse, cistern, pump, etc., at turn out ..... 600 00

One depot, with warehouse, passenger house, side tracks, sliding sections, turn tables, etc. .... 4,000 00

16 1/2 miles of superstructure, at \$3,749 87, 61,872 85

Engineering and contingencies ..... 12,606 50

\$138,671 57

**COST OF EQUIPMENT.**

2 locomotive engines ..... \$15,000 00

2 passenger cars ..... 3,200 00

10 freight cars ..... 6,000 00

24,200 00

Total cost of road and equipment ..... \$162,871 57

Adopting a rail of thirty-two tons to the mile, the weight of the Central railroad flat bar, the cost of road would then be ..... \$134,051 57

Equipment ..... 24,200 00

Total cost of road and equipment ..... \$158,251 57

**COST OF MAINTENANCE AND WORKING.**

The cost per annum of maintaining the road, as derived principally from the working of one of the principal railroads of this State, may, for the wood work, be estimated as equal to a renewal once in six years, or about seventeen per cent.; for the iron, as equal to a renewal once in twenty years, or five per cent., and the deterioration or washing of the earth work, at one per cent.—These items will be as follows:

17 per cent. on cost of wood work ..... \$4,095 78

5 per cent. on cost of iron ..... 2,145 00

1 " " " earth work ..... 442 56

\$6,683 34

The cost of working the road, will, of course, depend very much on the amount of business. The cost of working the road before alluded to, is found to be about thirty-seven cents per mile run, against thirty-one for maintenance. But in view of the probable amount of business upon the proposed work, it is believed to be safe to place the cost of working as equal only to the cost of the maintenance, or ..... \$6,683 34

To which add cost of maintenance, 6,683 34

Total, . . . . . \$13,366 68

**AMOUNT OF BUSINESS.**

The following shows the number of passengers, by stage, and amount of freight between Gordon and the direction of Milledgeville, for the year 1845 and 1846, as furnished by the company's agent at that station:

1845—Passengers ..... 1,590  
" Bales of cotton ..... 4,677  
" Other freight, tons ..... 687  
1846—Passengers ..... 982  
" Bales cotton ..... 4,593  
" Other freight, tons ..... 905

Of course the discrepancy in the number of passengers between the two years, is owing to the Legislature holding a session in 1845, and not in 1846. It is estimated by the agent, that 1,000 persons passed between Gordon and Milledgeville, in the same period, by private conveyance.

The following, in relation to the probable amount of business that would offer, was furnished by a gentleman who has given much attention to the subject. I submit it without expressing any opinion of my own, not being in possession of the facts, with the exception of the above statement, on which an opinion might be based. That the facilities which a railroad would afford, would greatly increase the business, admits of no doubt.

**ESTIMATED RECEIPTS.**

17,000 bales of cotton ..... \$5,100  
Other freights—Baldwin ..... 4,000  
" " Putnam ..... 2,500  
" " Jones ..... 1,000  
" " Jasper ..... 2,500  
" " Penitentiary ..... 2,000  
" " Factory ..... 1,500  
Receipts from mail ..... 1,000  
" " passengers ..... 5,000

\$24,600

Which, after deducting expenses, would be equal to 7 per cent. upon the capital.

Permit me here to express the hope, that this work, so important to Milledgeville, and I may say, the interest and convenience of the State at large, will not fail of speedy accomplishment. To secure this end, it would seem but just, if I may express the opinion, that the State, if necessary, should come to its aid, by taking stock that would amount to a tax upon the public property in Milledgeville, equal or approaching that voluntarily assumed by the citizens of Milledgeville for the same purpose. The advantages to the State, in the item of transportation for the penitentiary, and in the enlarged market it would afford for its manufactures, must be obvious. Another important feature is, that on the completion of the Wilkes county road, which now appears to be placed beyond doubt, cars could be run from the very gates of the penitentiary to the State road at Atlanta—when it might become the work shop for many of the equipments, now furnished from the north, and elsewhere, at much greater expense.

In alluding to this subject at all, I do not wish to be understood as in any way conveying the views, on this point, of those interested in the work. These brief remarks are made entirely without previous consultation with any one. I am not apprised that it is contemplated to apply to the State, thro'

the Legislature, for such aid. My object is only to show forth the grounds upon which a claim might be fairly based.

In conclusion, permit me in this manner to express my thanks to Col. Kenan, Mayor, and to the other citizens of Milledgeville and its vicinity, to whose co-operation in the field and elsewhere, I am much indebted.

F. P. HOLCOMB, Civil Engineer.

#### Atlantic and St. Lawrence Railroad. Annual Report.

We have received a copy of the report, giving the proceedings of this company up to 1st August last; from which we learn that they are making good progress. Twenty-eight and a half miles were then under contract, and a large portion of the work done—and eighteen and a half miles more were to be—and were—put under contract on the 10th of August, making 47 miles, or about one-third of the distance to Canada line.

We give the engineer's report in full—that the character of the country and the condition of the work may be understood. We also give an extract from the president's report, that the undeveloped resources of the country may be judged of; and from these it will be seen that the route, as a whole, is not only an exceedingly favorable one, but also that the completion of the road will open the door to resources and power, which would be of little value, at least for a long time to come, without it.

The terminus of the road at India wharf, in Portland, is exceedingly well situated for the transaction of an extensive business. It has a large water front with ample depth of water for shipping, and space for depot buildings, without interfering with the ordinary business of the city, and without being distant from, or inconvenient to, the principal business streets.

On a recent visit to Portland, we could see a manifest improvement in the appearance of the place—as compared with two or three years ago—showing that the influences of works of internal improvement are apparent from the date of their location—or at least long before their completion.

The people of Portland have done nobly in this matter, and they will find their interest in its results. They have also commenced a large establishment for the construction of locomotives and machinery; the buildings now nearly completed, are 300 feet long, by 60 feet wide—erected in a very substantial manner—near the depot.

We understand also that a rolling mill, for railway iron, is to be erected there at an early day—thus preparing to furnish the road, and at the same time to give it business.

It will be observed by Mr. Morton's report that the heaviest grade from tide is only fifty feet to the mile, and only thirty-five feet towards tide, or in the direction of the heaviest business; which is at this day, comparatively, not difficult to be overcome—and the curves are easy, with a large proportion of straight line.

Our readers, however, can appreciate its favorable points, and therefore we refer them to the ENGINEER'S REPORT.

ENGINEER DEPARTMENT,  
August 2, 1847.

HON. W. P. PREBLE, President Atlantic and St. Lawrence Railroad Company.

SIR: I have the honor to submit a brief report of the operations of this department during the past year, and the present state of your work now in progress.

At the date of the last annual meeting of the stockholders there had been 11 57 miles of the road located, and the grading placed under contract. The work was commenced about the 20th of August last, and has been progressing steadily up to the present time.

At that date, also, the preliminary surveys for a further extension of your road were in progress, embracing the examination of two routes, known as the Eastern and Western routes, extending from North Yarmouth to a point near Mechanic Falls, a distance of about 24 miles.

The results of these surveys were submitted to the board on the 22d of August, and soon thereafter the western route was adopted and a location ordered.

The line was located to a point in the town of Danville, a distance of 17 12 miles, and the grading and bridging let to responsible parties on the 23d of November last. A portion of this work was commenced in December, but the severity of the winter and the lateness of the spring prevented the contractors from progressing as rapidly as was desirable.

The contractors on the whole line have, during a portion of the spring and summer, labored under much embarrassment, resulting from the great scarcity of laborers and teams.

These difficulties have been enhanced in consequence of the large number of public works now in course of construction, and the great demand for laborers in this vicinity.

A large amount of work has, however, been done, and the grading of a number of sections is now nearly completed.

The total length of line now under contract is 28 69 miles, and it is divided into 18 sections, varying from 1 to 2 1/2 miles in length.

Section No. 1 extends from India wharf to Martin's Point road, and is 2 12 miles in length.

The total amount of excavation and embankment in the roadbed of this section is 72,000 cubic yards, of which 11,000 cubic yards are rock.

There have been 45,000 cubic yards removed, leaving yet to be excavated 27,000 yards, of which 2500 yards are rock.

There are 6,000 cubic yards of sea wall on this section, one-half of which is now completed.

The total length of pile bridging is 4,500 feet, 2,500 feet of which is nearly finished. The timber and piles for the remaining bridging are nearly all delivered and its construction is to be commenced immediately.

The cribwork for the wharf, and the filling in for depot grounds are under contract and progressing satisfactorily.

Section No. 2 is about one mile in length. The work on this section is done except the ballasting for the track.

Section No. 3. Length one mile. There yet remains on this section 8000 cubic yards of earth and 1500 yards of rock to be removed from road bed; the masonry is completed.

Section No. 4 is .95 of a mile in length, and embraces the heavy work at the Presumpscot river.

There have been 67,000 cubic yards of earth excavated and deposited in embankment, and there yet remain 32,000 yards to be removed.

The bridge for crossing the Presumpscot river has two spans of 150 feet each, and its total length is 320 feet. The roadway is to be on the top of the trusses which are elevated 27 feet above tide.

The east abutment of the bridge is nearly completed, and the foundation of the pier is ready for the reception of the masonry.

The work for the foundation of the west abutment is in progress.

The steam under water excavator is now removing the mud and a considerable portion of the rock is laid bare.

A large portion of the stone required to complete the masonry is already delivered.

Sections Nos. 5, 6, 7, 8, 9 and 10, embracing a distance of 6 1/2 miles, are all completed except dressing the slopes, etc.

Section No. 11 is 2 1/2 miles in length, and the work is light. There have been 10,000 cubic yards of earth excavated, and a portion of the materials delivered for the bridge at Royal's river.

This bridge has one span of 120 feet, and is elevated 12 feet above the river. Section No. 12 is 2 35 miles in length.

The excavations and embankments on this section are generally light. There is, however, a considerable amount of masonry required for the bridge at the east branch, of Royal's river. There have been 9,000 cubic yards of earth excavated, and 900 yards of stone delivered on this section.

Section No. 13 is 2 4 miles in length, and the total amount of earth to be removed is 83,000 cubic yards. One-half of this work and all the culverts are completed.

Section No. 14. Length 2 48 miles. The work on this section is of a more expensive character.

Total amount of excavation is about 100,000 cubic yards, one-fourth of which is now done and the masonry nearly completed.

Section No. 15 terminates near Woodman's and is 1 93 miles in length. The grading of this section is not heavy, and there is but a small amount of mechanical work. About one fourth of the earth work is finished, and all the masonry is advancing rapidly to its completion.

Section No. 16. Length 2 miles. The total amount of earth to be removed from road bed, and new channel for Royal's river, was 87,000 cubic yards. The river has been changed at several points, by which the construction of two bridges on this section has been avoided.

There yet remain three bridges to be built of 60 feet span each, the materials for which are now being delivered. One-half the earth work and two-thirds the protection wall on this section are completed.

Section No. 17 is nearly 2 1/2 miles in length and terminates at the Danville road. The work on this section is not in advanced state. The channel of the river has been changed on this section, by which two bridges are avoided.

There is one bridge of 90 feet span to be constructed. Considerable progress has been made in the grading, and one-half of the protection wall is finished.

Section No. 18. Length nearly  $1\frac{1}{2}$  miles, and terminates at the Hotel road. The work on this section has been commenced, but not much progress has yet been made.

Measures have been taken to increase the force on all the heavier sections in order that the whole grading may be completed at nearly the same date. The portion of the line now under contract comprizes the heaviest work on your whole road, and if we except section No 1, the cost will still be less than the average of most other roads.

On nearly one half of the line now under contract, the cost of grading and bridging will not exceed \$5,000 per mile. The excavations and embankments have been laid out for a single track, having a width of 22 feet in excavation and 15 feet on embankments. The slopes are in the ratio of  $1\frac{1}{2}$  ft. base to 1 foot rise. The larger mechanical structures are designed with a view to a double track. The pile bridges are both in the vicinity of the terminus and are constructed of the requisite width for two tracks.

The masonry for the Presumpscot bridge, and other structures which cannot be enlarged hereafter for the second track, without great difficulty and excessive cost, have been designed for a double track. The woodwork is for a single track, and so arranged that the additional width for a second track may hereafter be given without any interruption to the traffic of the road or difficulty in the execution of the work.

The total disbursements through this department up to the 1st of August, 1847, amount to \$131,175 99.

By a resolution of the board, dated June 21st, 1847, the extension of your road was ordered to a point in the town of Paris.

The location of this division of the road has been made, and the work advertised for letting on the 10th inst.

The length of this division is 18 57 miles, making a total distance from Portland of 47  $\frac{1}{2}$  miles. The work on this division is unusually light, and the soil is generally sand.—There will be but a trifling amount of rock excavation on the whole line.

The alignment of the road is favorable—there being 37 13 miles, or 78 per cent. of the whole line straight.

The following is a synopsis of the grades of your road so far as located :

Level.....	12 58 miles.
Less than..... 5 feet per mile.	1 75 "
from 5 to 10 " "	3 60 "
" 10 to 15 " "	3 55 "
" 15 to 20 " "	6 21 "
" 20 to 25 " "	6 07 "
" 25 to 30 " "	3 07 "
" 30 to 35 " "	10 40 "
	47 26 "

Before closing this report, it is proper that I should briefly allude to the surveys made at an early period for other portions of your road, and the general features of the country through which it passes.

From reports heretofore submitted to the

board you are aware that your present engineer department was organized about the 1st of November, 1845, and that the fall and winter were occupied in making preliminary surveys of the various routes proposed for your road.

The great extent of country to be examined, and the advanced period of the year at which these examinations were commenced, necessarily required that the field operations should be continued through a considerable portion of the winter.

These surveys extended over the whole country between Mechanic Falls and the boundary line of Canada, embracing a great variety of routes, a number of which passed through a new section of country, in the survey of which at that inclement season of the year many difficulties were encountered.

The whole was completed by the middle of February, 1846, giving an extent of line surveyed of over 250 miles, and the results of these examinations reported to the board in the month ensuing.

Without again repeating the elaborate details of the various surveys, which have been given at full length in the several reports heretofore submitted, I would only here observe that those examinations demonstrated that the country was of the most favorable character for the cheap construction of your road, with grades and curvatures—admitting of great speed and economy of transportation.

That the distance from the Province line to Portland by the *longest* route surveyed, was about 150 miles, and that the line follows for nearly the whole distance the vallies of large streams, allowing gentle grades which are generally descending towards the seaboard.

The principal undulation in the profile of the road is in passing from the Connecticut to the Androscoggin valley, and from the latter to the Little Androscoggin.

Commencing at the boundary line and following this route, the average descent of the Connecticut valley to Northumberland, a distance of 30  $\frac{1}{2}$  miles, is 6  $\frac{1}{2}$  feet per mile; thence following up the Ammonoosuck river to the summit between it and the Androscoggin, a distance of 22 miles, the average ascent is 9  $\frac{1}{2}$  feet per mile, and from the latter point to Bethel where the line leaves the Great Androscoggin river, a distance of 29  $\frac{1}{2}$  miles, the average descent is 14  $\frac{1}{2}$  feet per mile.

Thence ascending to the head waters of the Little Androscoggin, a distance of 18  $\frac{1}{2}$  miles, the average ascent is 3 19 feet per mile; thence following down the Little Androscoggin to a point where the line strikes across to the valley of Royal's river, a distance of 21  $\frac{1}{2}$  miles, the grades maintaining the requisite elevation to pass without a summit, the average descent is 15  $\frac{1}{2}$  feet per mile.

From this point to Portland the distance is 28  $\frac{1}{2}$  miles, nearly the whole of which distance the road follows the valley of Royal's river and its branches, or other small streams: having but few undulations, and no grades that will exceed 35 feet per mile.

These vallies are all favorable, being ge-

nerally broad and having nearly an uniform descent and a good general direction.

The ground is such as to permit a favorable distribution of the rise and fall, requiring no excessive cuttings or embankments.

The above indicates the general features of the vallies followed by your road. In adapting the grades to the ground so as nearly to conform to its general surface and to permit the most economical construction, greater inclinations will of course be required than those above given. The maximum, however, ascending *west*, will not exceed 50 feet per mile, and ascending *east*, 35 feet per mile—both being comparatively for a short distance.

From the character of the business which will be done on your road, it is evident that much the greatest amount of tonnage will be in the direction of the seaboard, and it therefore becomes important in its location, that the grades should as far as practicable be so arranged as to favor the preponderance of the trade.

The character of the country fortunately enables us to accomplish this to a very great extent. From an examination of the profile of the line, it will be observed, that over 110 miles of your road will be either *level* or *descending towards the Atlantic*, and that a large portion of the remaining distance, the grades are gentle, and in no case will exceed 35 feet per mile.

The country through which it passes is mostly a well cultivated and fertile agricultural district, and abounds in all the elements of wealth. There is an unequalled extent of water power in the vicinity of the line, a portion of which is improved, and it only requires additional means of intercommunication to bring the whole into successful operation, and to develop the great resources of the country.

Your road in connection with the St. Lawrence and Atlantic road in Canada forms a perfect line from the Atlantic at Portland to the St. Lawrence at Montreal, and adopting the *longest* route yet surveyed for each of these roads, it is much shorter than any other line of roads yet projected between the St. Lawrence and the seaboard.

The arrangement entered into by your company with the Provincial corporation, provides that the whole business of the two roads shall be done upon the same basis, and rendering them, so far as the cost of transportation is concerned, nearly equivalent to one line.

All the other routes between the St. Lawrence and the seaboard, which may come in competition with your road for the western trade, will labor under the disadvantage of not only being much longer, but will be operated by six or seven different corporations. All of these corporations having a separate organization of officers, agents, engineers, etc., and each furnishing their own motive power for their respective roads, several of which are short, and operating the whole in connection, are subject to greater expense than one corporation working an equal aggregate length of road.

Your road and that of the Provincial cor-

poration are of such length as will permit their being operated in the most economical manner, which, together with their superiority in other respects, will enable you to compete successfully with any rival road.

In conclusion it may be well to observe that the Provincial corporation is vigorously prosecuting the construction of its road, 45 miles of which are now under contract. It is expected that 30 miles will be completed and opened for business in August next.

This part of the line passes through a level and highly cultivated country, affording great facilities for the construction of a perfect road.

On that part of the road now located, the grades are uniformly easy, and nearly 95 per cent. of the line is straight. That corporation is extending its surveys with a view to determine definitely the route to the boundary line, and the most feasible point for uniting with your road.

With the same object in view, and in compliance with a resolution of your board, I am also about to commence the surveys on this side of the boundary.

I have the honor to be, sir,  
Your obedient servant,  
A. C. MORTON,  
Chief Engineer.

The financial condition of the company is exhibited in the TREASURER'S REPORT.

The treasurer of the Atlantic and St. Lawrence railroad company, in compliance with the by-laws, respectfully submits to the stockholders a report of the transactions of the office to the 31st July, 1847, inclusive.

The resources of the treasury to the above date have been from

Advance money on 10,189 shares.....	\$50,945 00
First assessment.....	47,295 00
Subsequent assessments.....	89,970 00
In advance for future assessments.....	11,337 07
Interest and notes payable.....	39,479 87
<b>Total.....</b>	<b>\$239,026 94</b>

The amount paid and finally chargeable to construction of the road, to January 31, 1847, inclusive, is the

Amount paid contractors for labor and materials delivered.....	\$108,671 74
Engineer department, including instruments.....	22,504 25
Corporators' expenses for surveys, printing, etc.....	3,315 60
Office, agency and general expense accounts and interest.....	9,626 65
Fencing.....	1,888 27
Depot lands (of which \$38,000 by notes of the company).....	51,391 25
Land damages, (\$195 30 of which by note of the company to guardian of a minor).....	18,876 40
<b>Total.....</b>	<b>\$216,274 16</b>

The treasurer's books and accounts have been examined and found to compare with the trial balance sheet as adopted by a committee appointed by the directors.

There have been five assessments of \$5 per share made by the directors; the fourth was payable only on the 26th July, and the fifth is not payable till the 28th August, inst.

In the purchase of the real estate for depot accommodations, a credit was allowed on an

amount of \$38,000; and adjusted by notes of the company on time as follows:

\$15,000—payable in 1 to 15 years, interest semi-ann.	
10,000 " 10 " " "	
8,000 " 1 to 8 " " "	
5,000 " 15 " " "	

with a mortgage of the premises as additional security. And on settlement of a life lease on one part of the premises, the company, under an award of the county commissioners, are obligated to pay an annuity of \$40, during the life of the lessee and her mother, and the survivor of them.

CHAS. E. BARRETT, Treasurer.  
Office A. & St. L. R. R. Co.,  
Portland, August 24, 1847. }

We make the following extract from the president's report, descriptive of the country through which it passes, and illustrative of its vast resources to be developed, and improved by the road; which, in turn, will be sustained, and its proprietors and the people of Maine enriched by its rapid and vast increase. He says—

"At their recent session the legislature of New Hampshire passed an act constituting the Atlantic and St. Lawrence railroad company a corporation within that State. The act is liberal in its provisions, and grants to this company all the powers it could reasonably ask for. It places the location, construction and management of the road in its whole extent from the Canada line to Portland, in the hands and under the control of the same company and under the regulation and management of the same board of directors.

"All objections to passing through New Hampshire being removed, the general route of the road may now be regarded as definitely settled. Commencing at the foot of India street on the navigable waters of Portland harbor, it passes onward about 11 miles to the valley of Royal's river at Gooch's falls, near the villages of North Yarmouth. Here the eastern sea board travel would naturally fall on to it. Following up the valley of Royal's river about 16 miles, it crosses the Danville road to a point distant about six miles from Lewiston falls. Here the Androscoggin and Kennebec railroad now in progress of construction connects with it, opening to, and bringing in upon it, to a large extent, the travel and business of Lewiston falls—of the Androscoggin valley—of the upper portion of Kennebec county, and also of the interior counties of Franklin and Somerset. Passing onward, leaving the valley of Royal's river, following up the valley of the Little Androscoggin, it strikes and crosses that river at Mechanic Falls, distance about 10 miles.—Here the Buckfield branch railroad recently chartered will connect with it, and here the road will receive the travel and business of that thriving and productive section of country. Pursuing upward the valley of the Little Androscoggin, passing in the vicinity of True's Mills, and Factory village, so called, or Craigie's Mills, about 10 miles, it reaches Paris Cape in the vicinity of Norway and Paris, drawing in upon it the travel and business of that rich and populous region. Still following up the valley of the Little Androscoggin, passing on the way Snow's Falls and

Bacon Falls, it reaches Bryant's pond, the source of that river. This point is 15 miles from Rumford Falls, on the Great Androscoggin, one of the greatest and most available water powers in New England. Passing from Bryant's pond into the valley of Alder stream by Lock's Mills, the route strikes the bank of the Great Androscoggin near Bethel Hill village, distant from Paris Cape about 22 miles. Here the road will command the travel and business of the whole valley of the upper Androscoggin and of the Megalloway. Crossing the Androscoggin at Bethel, and following up its picturesque and romantic valley, bordered by the highest mountains in New England, the road in its course of about 20 miles, reaches Gorham in New Hampshire, distant from the base of Mt. Washington five miles only. From this point that celebrated mountain may be approached and ascended with more ease, in a shorter distance, and less time, than from any other accessible quarter in the vicinity of the White Hills. This point also is only five miles distant from Berlin Falls, the greatest waterfall in New England, where the waters of the Great Androscoggin, larger in volume than the waters of the Connecticut, descend nearly 200 feet in a distance of about two miles. From the valley of the Androscoggin, the road passes on a gradient of six miles of forty feet to the mile, over grounds of 1116 feet only above the tide waters of Portland harbor, into the valley of the Connecticut, reaching the banks of the Connecticut in the region of Lancaster and Northumberland in New Hampshire, and Guildhall in Vermont, distance about 26 miles. Here it is manifest the road will receive the travel and the business of the upper valley of the Connecticut and its tributaries, embracing the county of Coos in New Hampshire, and an important section of Northern Vermont.

"Here also the "Montreal" railroad thro' central New Hampshire will in due time it is hoped connect with ours, and form a circuit for the pleasure travel of the seaboard of N. England, passing from Boston by way of Concord and Meredith in the valley of the Merrimac to Lancaster, thence round north of the White Hills, and down the valleys of the Androscoggin and other rivers to the Kennebec country and Portland, and thence by steamboat or railroad to their places of residence. Following up the rich and highly cultivated valley of the Connecticut about 35 miles, the road reaches the parallel of 45 degrees north latitude, and connects with the St. Lawrence and Atlantic railroad at the boundary between the United States and Canada. Here, of course, the friends of the enterprize expect to receive for transportation to the seaboard the passengers and freight of the sister company, consisting of the rich productions of the west, and Canada, and of passengers seeking their way to Atlantic ports."

It may well be anticipated that, when this and the other roads now in progress in New England, shall have been completed, the pleasure travel will be largely increased, and that much of it will pass over this road on its way to or from the "White Hills" of New Hampshire and Montreal.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.**  
Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse B. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**SPRING STEEL FOR LOCOMOTIVES.**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

1y

**RAILROAD IRON.—100 TONS ENGLISH,**  
60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
68 Broad Street, New York.

1m37

**FOR SALE—300 TONS (10 MILES) FLAT**  
Bar Rail, in parcels or wholesale—section 2½ inches wide by 1 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
Wilmington, Del.

1m37

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

FOR  
PASSENGERS, SPECIE, GOODS, PARCELS, etc.  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise.] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

ROBERT GRACIE.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAML KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

41f

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.  
ja45

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers, etc., by  
JOHN A. ROEBLING, Civil Engineer,  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.  
2v191y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arrester have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.  
Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merrin, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callen-lers; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestles are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestles, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestles for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.			
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686	96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57	24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101	25
Workmanship free of patent charge.....		600	00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 33tf

### LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

### RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Dec. 25, 1y\* Pres't. Mt. Savage Iron Works, Maryland.

ENGINEERS' AND SURVEYORS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.

ANDREW MENEELY.

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents,  
1y48 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its availability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.			Weight per fathom.	Diameter of iron.	
	INCH.	LBS.	OZ.	INCH.	LBS.	OZ.		LBS.	INCH.	Tons.
11	4½	13	5	10	24	-		50	15-16	20
13	3½	8	3	8½	16	-		27	11-16	13½
14	3½	6	11	7½	12	8		17	9-16	10½
15	2½	5	2	6½	9	4		13½	1-2	7½
16	2½	4	3	6	8	8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

Philadelphia, Pa.

1y35

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

Reading, Pa.

ja45

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

(Signed,)

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

(Signed,) G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

(Signed,) T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

(Signed,) JOHN LEACH,

Jamaica November 12, 1845.

Sup't Motive Power

## THE SUBSCRIBERS, AGENTS FOR

the sale of

Codorus,

Glendon,

Spring Mill and

Valley,

Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846.

[1y4]

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**MANUFACTURE** their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " { × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, mos. from delivery of brick on board. Refer to

James P. Allaire, }

William Parker, Supt. Bost. and Worc. R. R.  
New Jersey Malleable Iron Co., Newark N. J.  
Gardiner, Harrison & Co. Newark, N. J.  
35,000 to 30,000 made weekly. 35

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**LAP-WELDED WROUGHT IRON TUBES** for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 28f

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drifts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures. 11f

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK &amp; CO.,

Philadelphia.

ROBERT NICHOLS, Agent,

No. 79 Water St., New York. 26f

**TO LOCOMOTIVE AND MARINE ENGINE** Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER &amp; MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 11f

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly enclosed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28f

J. BALL &amp; CO.

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz: Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**LITTLE MIAMI RAILROAD.—OPEN**  
TO SPRINGFIELD—Distance 84 miles—  
connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co.'s daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield. Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

**FARE.—From Cincinnati to Lebanon....\$1 00**  
" " " Xenia..... 1 50  
" " " Springfield... 2 00  
" " " Columbus... 4 00  
" " " Sandusky city 8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1 P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47tf W. H. CLEMENT, Sup't.

**PATERSON RAILROAD**  
Summer Arrangement.  
Commencing April 20th, 1847, the cars will leave  
Paterson at New York at  
8 o'clock a.m. 9½ o'clock a.m.  
11½ o'clock a.m. 12 1-4 o'clock p.m.  
4 o'clock p.m. 5½ o'clock p.m.  
On Sunday,  
8 o'clock a.m. 9½ o'clock a.m.

Through tickets to Harrisburg or Gettysburg... 3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owing's Mill, arriving at the Mills at.....5½ p.m.  
Returning, leaves Owing's Mills at.....7 a.m.  
D. C. H. BORDLEY, Sup't.  
Ticket Office, 63 North st.  
31 1y

**L EXINGTON AND OHIO RAILROAD.**  
Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 351y

**CENTRAL AND MACON AND WESTERN**  
Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad .....190 Miles.  
Macon to Atlanta—Macon and Western.....101  
Atlanta to Oothcaloga—Western and Atlantic.. 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	To Atlanta.	To Oothcaloga.
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50		0 62½
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20		0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20 pr. 100lbs.		35
Crockery, per cubic foot.....	0 15		35
Molasses and Oil, per hhd., (smaller casks in proportion).	9 00		12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25		1 50
Ploughs, (small,) and Wheelbarrows.....	0 80		1 05
Salt, per Liverpool Sack.....	0 70		0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.			

Goods consigned to the subscriber will be forwarded free of Commissions.  
Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.  
Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH**  
to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods..... 13 cts. per cubic ft. On brls. wet (except molasses and oil).....\$1 50 per barrel. On brls. dry (except lime).... 60 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred. On hhds. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd. On molasses and oil.....\$6 00 per hhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**  
Passenger Train runs daily from Charleston, on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculum Railroad in N. Alabama. Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculum..... 22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.  
JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**  
Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculum, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAILROAD**  
line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4½ p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

#### FARE BETWEEN NEW YORK & PHILA.

First class cars.....\$4 00  
Second class cars..... 3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board. Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies use. Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25tf

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville,	92	\$3.50	and \$3.00
" " Reading,	58	2.25	and 1.90
" " Pottsville	34	1.40	and 1.20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets. 811

# PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting with Mail Lines North, South & West.  
On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R.  
Leave Philadelphia at 3½ p.m. } No line on Sun-  
Leave Baltimore at 3 p.m. } day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12½ p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wil-

mington to Philadelphia, 7 a.m., 1 p.m., mail, 4½ p.m., 7 p.m., 12½ a.m., night mail.

J. R. TRIMBLE,  
Engineer and General Superintendent.

# GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO DALTON, 100 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 408 miles in length, from Charleston to Dalton (Cross Plains) in Murray county, Ga.—33 miles from Chattanooga, Tenn.

the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 408 miles in length, from Charleston to Dalton (Cross Plains) in Murray county, Ga.—33 miles from Chattanooga, Tenn.

## RATES OF FREIGHT.

	Between Augusta and Dalton. 271 miles.	Between Charleston and Dalton. 408 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 18	\$0 28
2d class. Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 40	0 65
Cotton, per 100 lbs.....	0 45	0 75
Molasses, per hogshead.....	8 50	13 50
" " barrel.....	2 50	4 25
Salt per bushel.....	0 18	
Salt per Liverpool sack.....	0 65	
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows.....	0 75	1 50

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad & Co. will be forwarded free of commissions. Freight payable at station.

Supt. of Transportation.  
Augusta, Ga., July 15, 1847. 4417

## RATES OF FREIGHT

On CHANDLER'S Through Transportation Line, between Charleston, S. C., or Savannah, Ga., and Decatur, Ala., and Knoxville, Tenn., and all intermediate points on the Tennessee River, viz:

Between Macon and Decatur and intermediate points.	0 22½	1 54	1 05	0 21	0 66
and Knoxville & intermediate points.	0 22½	1 54	1 10	0 75	0 81
and Chattanooga.				0 61	0 86
Between Augusta and Decatur and intermediate points.	0 21	1 70	1 15	0 85	0 90
and Knoxville & intermediate points.	0 21	1 70	1 20	0 80	0 90
and Chattanooga.				0 65	0 85
Between Charleston or Savannah and Decatur and intermediate points.	0 32	2 30	1 40	1 05	1 10
and Knoxville & intermediate points.	0 32	2 30	1 40	1 00	1 10
and Chattanooga.				0 85	

1st class.—Boxes of Hats, Bonnets and Furniture per foot.....	
2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cans) Drugs, Confectionaries, Shovels, Spades, Sifters, Smiths' Bellows, Baskets, Tubs, Sifters, Brooms and other light articles, per 100 lbs.	
3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheese, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casks, or Crates of Crockery, Hard ware, and other heavy articles not enumerated below.	
4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Limestone Oil, per 100 lbs.	
Per 100 lbs.	Cotton.

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.: and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.  
Chattanooga, Tenn., July 1, 1847.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.  
The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1836 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as the numbers can be reprinted—by application to the Editor.

## ENGINEERS and MACHINISTS.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, October 16, 1847.

### Gillespie on Road Making.

We have received from the publishers, Messrs. A. S. Barnes & Co., of New York, a copy of this work; but at so late an hour that we have not been able to give it even a casual examination in time for this number of the Journal. We therefore now merely give the following advertisement, and the letter of Professor Mahan, of West Point, and shall refer to it again at an early period.

**GILLESPIE'S WORK ON ROAD MAKING.**  
A Manual of the Principles and Practice of Road making, comprising the Location, Construction and Improvement of Roads, (Common, Macadamized, Paved, etc.) and Rail Roads, by W. M. Gillespie, Professor of Civil Engineering in Union College. Published by A. S. BARNES & CO., 51 John St., New York.

LINDSAY & BLAKISTON,  
GRIGG, ELLIOT & CO., } Philadelphia.

### RECOMMENDATION FROM PROFESSOR MAHAN.

"I have very carefully looked over Professor Gillespie's Manual of Road Making. It is, in all respects, the best work on this subject with which I am acquainted; being, from its arrangement, comprehensiveness and clearness, equally adapted to the wants of Students of Civil Engineering, and the purposes of persons in any way engaged in the construction or supervision of roads. The appearance of such a work, 20 years earlier, would have been a truly national benefit, and it is to be hoped that its introduction into our seminaries may be so general as to make a knowledge of the principles and practice of this branch of engineering, as popular as is its importance to all classes of the community.

(Signed,) D. H. MAHAN,  
Professor of Civil Engineering in the Military Academy of the United States."

### Improved Steam Engine.

To the Editor of the Railroad Journal:

In your number of June 12th, there is a notice of some important improvements in the steam engine, purporting to have been made by Mr. C. C. C. Smith of Boston.

Now the improvements therein spoken of, have all been in successful operation. I have seen them attached and working on a land engine, and I believe they were attached to the engines of the ill-fated President, or some other of the Liverpool steamers. Certain it is, that Mr. Samuel Hall's English patent covers the whole ground, with the addition of a simple distilling apparatus, to supply whatever waste of pure water might occur. Yours, etc., H.

It is but just to the writer that we should say that the communication of "H." was received early in July last. We have heard nothing further in relation to Mr. Smith's improvements since our article above alluded to, but we should like to.

### New Orleans and Carrollton Railroad. Correction of Table.

The following letter was received early in July, and prepared for the compositor at the time, but by some accident mislaid until the present time. It is not, however, too late even now to correct errors and record facts—we therefore give it a place, and thus acknowledge its receipt, and apologise for its delay, at the same time.

To the Editor of the American Railroad Journal:

In your Table of Railroads you have named that from New Orleans to Carrollton, (No. 147) the "Carrollton and Brandon." I know of no such road; it ought to be the New Orleans and Carrollton railroad, which was chartered in 1833.

It was first opened in 1835. It is 5½ miles in length, from end to end. It cost \$300,000!! The rail is principally 3½ x 3, laid on cross ties 3 feet apart, and weighs 47 lbs. per yard. There was originally a double track in use for 5 miles—now there is but about 3½ miles, where the double track is kept up, (though it is fast becoming necessary to have the double track the whole extent.)

There is a branch of about a mile at right angles to the main line, used for horse cars only, on which a large business is done: the iron on which is 2½ x 1—though this is being replaced with a stronger flat bar.

The least radius of curvature is in the streets of New Orleans, and is 150 feet. The highest grade

per mile will not exceed 9 or 3 feet. The fare per mile is 4 cents.

There is a commutation of two kinds.

The enclosed advertisement will give some other information. Yours respectfully,

JOHN HAMMON, Engineer.

Carrollton, La., June 26, 1847.

It appears, from the advertisement, that the plan of commutation is arranged to accommodate the people—to induce them to ride—and even to sending the children to school. Tickets are sold for grown persons at \$30, and children going to school at \$6, a quarter. In this way a large amount is received which would not be under different system of management.

### Locomotive Workings.

The London Morning Herald is giving frequent comparative statements of the workings of locomotive engines on the English railways. It recently published a contrast between the working of three of the uniform gauge engines, the "Mazeppa," on the South Western, taking a train of 40 tons; Crampton's "London," with 60 tons; and Stevenson's "Snake," with 70 tons, on the London and North Western. Stevenson's engine, with pilot assistance, up the Camden Town incline, and in calm weather, performed the distance to Tring, nearly 32 miles, with the 70 tons, in 44m. 40s.; and Crampton's engine, without pilot aid, did it, with a slight side wind against her, in 44m. 10s., with 60 tons; the South Western engine, with a slight side wind against her, but with the better gradients, ran the 30 miles, with 40 tons, in 43m. 2s.; Stevenson's, with 70 tons, in calm weather, and assisted up the Camden incline, in 42m. 4s.; and Crampton's with a slight side wind, and without assistance up the Camden incline, took the 60 tons in 41m. 21s.: the maximum speed of the South Western engine, with 40 tons, was 54½ miles per hour, upon a falling gradient of nearly 21 feet per mile; Crampton's, with the 60 tons, 51½ miles per hour, upon a falling gradient of about 3½ feet per mile; and Stephenson's with 70 tons, 51½ miles per hour, upon falling gradients of 10 or 12 feet per mile. With the same trains, the South Western engine worked over 9 miles of rising gradients, averaging about 15 feet per mile, in 12m. 30s.; Stephenson's the same distance, over about the same gradients, in 11m. 9s.; and Crampton's in 11m. 48s. On other occasions, with 75 tons, the "London" attained a working speed of 56 miles per hour, and with 57 tons upwards of 60 miles per hour.—

The "Snake" took a morning mail with 70 tons at an average speed of about 31 miles per hour. All these workings are to be considered in the light of exceptional cases. It is most difficult to make anything like a perfectly fair contrast between the working of different locomotives, at different times, and over different lines. The steady working for successive weeks over the same ground with the same drivers, alone enables a correct judgment of speed and power to be formed. Still it is satisfactory to find constant attention turned to the subject.

Another of Mr. Crampton's engines has been completed for the Dundee and Perth, and made a satisfactory journey towards its destination, receiving in its progress many encomiums for its steadiness. We hear that upwards of 30 engines on this principle are in course of construction.

#### Items.

**The Great Rope.**—The great rope to be used on the Cowairs incline of the Edinburgh and Glasgow has arrived safely, and was landed at Granton pier. It weighed 9 tons 11 cwt.

**An Amusing Race.**—A race between a horse and a locomotive is reported to have taken place on the Newcastle and Berwick. It is related that as a locomotive was coming to Newcastle, near to Chat-hill, a spirited horse suddenly set off at full speed in front of the engine. The driver eased the engine, and endeavored, by frequent whistles, to drive the animal off the line, but in vain; for a full mile or more the horse held on his way with unabated speed. At length the engine coming rather close upon him, the animal darted on to the parallel line, still proceeded, and rushed once more in front of the engine. The driver, finding himself delayed, resolved to pass his opponent at all risks, and increasing his speed, soon came close upon his quarters, when the animal bounded aside, and kicked up its heels as the train passed, to the amusement of the whole train. The entire distance of the race was about four miles.

**Iron Bridges for Railways.**—The Commission for inquiring into the conditions to be observed by engineers in the application of iron in railway structures has been appointed. Lord Wrottesley, Professor R. Willis, M.A., Capt. Henry James, R.E., Messrs. G. Rennie, W. Cubitt and Eaton Hodgkinson are the commissioners, and Lieut. Douglas Gratton, R.E., is to be the secretary. We almost wonder scientific men accepted the office when the result of the gauge commissioners is remembered.

**Bradshaw's Guide** continues to march with the circumstances of the times. In the "Guide" for the present month the map distinguishes all lines that have the electric telegraph laid down upon them by a red line, and those in progress by a green line.

**Railway Signal.**—A Mr. Heinke has brought forward a mode of communicating with the engine-driver by means of a wire and bell—not a very novel suggestion.

**Paris and Boulogne Railway.**—The railway from Paris to Boulogne will shortly be opened within eight miles of Boulogne. Fast trains will then go from Paris in eight hours. The mails which leave Paris at 7 P.M., will arrive at Boulogne at 3 A.M., and if—as the Daily News observes—a postoffice steamer lay in the roads, ready for their conveyance to Folkestone, they would reach the latter place before 6, and, with a fast train, might be delivered in London before 9 A.M. Thus, by proper arrangements, the correspondence between Paris and London might be so regulated that the letters and despatches leaving either city in the evening, might be delivered in the other the next morning.

#### Contrasts Worthy of Record.

The millions, who are benefited by railways, can in no way so well understand the amount of their obligation, as by occasionally contrasting the past with the present, as is done in the following from the Devonshire Chronicle.

"It is within our recollection," says the Chronicle, "that we paid for the smallest parcel by coach 2s. 3d., which the rail now brings us for 1s. 6d. The parcels weighing above 56 lbs. were charged 11d. per lb.; thus the carriages of 100 lbs., by coach would be 12s. 9d.; by the rail we can have parcels of 100 lbs. for 3s. 6d. to 4s., and in bulk of 5 cwt. for 8s. 6d., or about 1s. 9d. per cwt.—to say nothing about the time of transit. The wagon which brought us our goods in seven or eight days did the tradesman the favor to charge him 7s. 6d. per cwt., while the gentleman was charged 10s. To men in large businesses, such as drapers, grocers, etc., the difference in the carriage charges would be at least £50 per annum, and the charge upon extra stock another £50. Then turn to the article coals. They were last winter—long and trying as that winter was—charged from 25 to 28s. per ton the best, but for the rail they would have been 30 to 40s. per ton; indeed it is not very long since coals were charged in Exeter 37s. 6d. for 12 cwt. Now then, let us ask, who derives the benefit of the cheap carriage of linens, woollens, sugars, teas and coals? Does anybody believe that the shopkeeper pockets the difference?—That is impossible; his next door neighbor would undersell him if he were to attempt it. It is therefore a demonstrated fact that the low prices at which articles of dress and grocery are sold in this city—lower we believe than in any other place of its extent—is mainly owing to the facilities given to business by the establishment of the railway."

#### South-Eastern Railroad.

##### Semi-Annual Meeting.

The Directors of this Company, at their half-yearly meeting, on the 16th of September, report that "the accounts of the South-Eastern for the half year ending on the 31st of July, 1847, show that the gross receipts of the company have amounted, during that period, to 217,874l. 2s. 5d.; that the working expenses have been 62,757l. 11s. 8d.; the rent of the Greenwich and Whitstable, 30,712l. 10s.; the rates, Government duty and toll of the Croydon, 26,308l. 4s. 8d.; making the expenditure on revenue accounts, 109,779l. 6s. 4d. The balance carried to the account of profit and loss is 108,095l. 16s. 1d.; and that account shows an amount at the disposal of the proprietors of 94,265l. 14s. 10d."

"The comparative statement of passenger traffic for the half-years ending on the 31st of July, 1846, and 31st of July, 1847, shows the following satisfactory result:—

1st Class.	2d Class.	3d Class.	Total.	£.	s.	d.
1847	112,915	258,279	405,513	776,707	129,966	12 5
1846	106,279	239,999	387,629	733,907	119,494	10 7

Incr's 6,636 16,280 17,884 42,800 £10,493 1 10

A similar statement of traffic on the Greenwich branch exhibits the following comparison:—

1st Class.	2d Class.	3d Class.	Total.	£.	s.	d.
1847	243,803	514,579	700,911	1,459,233	30,799	15 11
1846	239,575	504,805	691,667	1,433,747	30,869	1 10

Incr's 3,928 11,774 9,244 25,546

Decrease £69 5 11

The merchandise department has yielded 34,391l. 17s. 10d. during the last half-year against 25,796l. 11s. 6d. in the corresponding half year of 1846, showing an increase of 8,595l. 6s. 4d."

"The Directors feel it their duty to acknowledge

here the great advantage which the company has derived from the daily double passage each way between Folkestone and Boulogne, performed by the splendid steamships of the South-Eastern and Continental Steam Navigation Company. The double service commenced on the 1st of April, 1847; and the following table shows the extent to which the public have availed themselves of this facility, and of the consequent advantage which the South-Eastern has derived therefrom.

#### Passengers conveyed from April 1 to July 31.

	1846.	1847.	Increase.
To Boulogne	7,739	9,206	1,567
From Boulogne	7,252	8,897	1,645
	14,991	18,103	3,112

"The proprietors will doubtless agree with the Directors, that had the Boulogne and Amiens line been opened, the traffic would have been double what it has been.

"In conclusion, the Directors have once more to assure the proprietors of their devoted attention to the interests of the company, and of their confidence that those results which the proprietors have, with them, so long looked forward to, will now be realised."

The capital account of this company would alarm us in this country. The following statement shows the share account but not the lands.

#### Share Account, July 31.

##### DEBTOR.

First capital—Calls on 28,000 shares, at 50s. per share	£1,400,000	0	0
Second capital—Calls on 28,000 shares, at 25s. per share	700,000	0	0
Third capital—Calls on 28,000 shares, at 20s. per share	560,000	0	0
Shares paid in full	2,400	0	0
Fourth capital—Calls on 42,000 shares, at 17s. per share	714,000	0	0
Shares paid in full	1,522	6	8
Fifth capital—Calls on 31,500 shares, at 15s. per share	472,500	0	0
Shares paid in full	1,305	0	0
Sixth capital—Calls on 285,000 shares, at 6s. 5s. per share	1,781,250	0	0
Shares paid in full	12,428	15	0
	£5,645,406	1	8

We omit the details of expenditure of this vast amount of capital, and give only a few items, paid during the half year ending July 31, 1847, viz:

Parliamentary expenses	£78,626
Engineering	14,931
Land	111,761

We should have few railroads in this country, if our legislators worked for nothing and found themselves—and our land was owned by Lords and ladies!

The total expenditure of this company, up to July 1, 1847, appears to have been £6,396,218—or about \$32,000,000.

#### Atmospheric Railway.

The London Herald reports the late experiments on the South Devon atmospheric as follows: It says that "With a thirty ton train, a speed of 67 miles per hour was obtained; with 50 tons, 60 miles; and with 100 tons, 37 miles. Our contemporary adds—among the improvements a prominent one is to be found in the station arrangements. The passage of the piston is now made throughout the line without any interference with the rails, and minus any of the peculiarly formed switches that were adopted on the Croydon line. By a very simple contrivance the piston is lifted over the ordinary crossing rails with ease and certainty at the highest velocities; and the starting of the trains from a state of rest at the sta-

(ions, even before the piston has reached the exhausting tube, is most ingeniously contrived. The latter operation is effected by a supplemental tube, fixed completely outside the rails, and the connection between this tube and the carriage ceases immediately after the train has left the station and the train piston has left the propelling tube. Thus ordinary stations and station arrangements, in every respect suitable and convenient for locomotive purposes, are made available for working trains by atmospheric power. It is stated that the whole of the traffic between Exeter and Newton will be worked by atmospheric power in the course of a month."

#### Electric Telegraph Reporting.

We find the following paragraph in the London *Mechanic's Magazine*, for August. The writer claims, for the *Manchester Times*, of 7th August last, the credit of publishing the first Telegraphic Report of the proceedings of a public meeting. That may have been the first instance of the kind in England, or even in Europe, but not so in this country; as the proceedings of Congress have been published in Philadelphia—one hundred and forty miles distant; and in New York, two hundred and thirty miles from the capital, within the hour, almost, of the adjournment of the house; and the Message of the Governor of New York, delivered at Albany—making four or five columns of fine type, in the *Tribune* and *Herald*, and indeed all the Daily papers—was issued in the city of New York—150 miles distant—within an hour of the close of its reading in Albany. This was indeed an extraordinary performance then, but now, the same thing can be done over a line of at least five hundred mile—East ward, North ward and West ward—at the same time.

The paragraph referred to is as follows, viz: "The services of the electric-telegraph have at length been called into requisition for the purposes of the press. The second edition of the *Manchester Times*, Aug. 7, 1847, contains a report of a public meeting, supplied by the above means; and this, we are informed by the proprietors, is the first time that the electric telegraph has been made available for such a purpose."

#### Magnetic Telegraph.

The following circular was received by us early in September, but in consequence of several weeks' absence, it has not been published.

We know nothing of the particulars of the controversy between Messrs. Morse, Kendall, Smith & O'Reilly, and of course take no part or interest in it; we do, however, take a deep interest in the extension and improvement of the system—and therefore give place to Mr. O'Reilly's circular, in the belief that it may lead to a further investigation, and to competition, by which alone the system can be brought to afford the greatest benefit to community.

#### Progress and Results of Electric Discovery, with Special Reference to Telegraphing.

The unwarrantable attempts at monopoly in the telegraph enterprise—the assertion that no improvement in telegraphing can be used in the United States without "permission" from the controllers of a single patent—the denunciations fulminated against all who have dared to encourage improvement in this important enterprise—render it expedient that the public shall have ample opportunity for determining which of the American telegraphs is most original in character, and most valuable as reliable means of intercommunication between remote points: and, therefore, in behalf of associates in the "At-

lantic, Lake and Mississippi lines of Telegraph," I feel authorized to offer a premium of THREE HUNDRED DOLLARS for the best *Essay on the Progress of Electric Discovery, with Reference to the Telegraph System*. The Essays to be brief and comprehensive as the subject will admit—adapted to general circulation—but calculated to present the facts in the clearest light, that readers generally may determine for themselves the extent to which any one man may rightly fully claim exclusive property, "not merely in a machine," or mode of application, but in "the general principle" of electro magnetic telegraphs, "no matter by what combination of machinery that 'principle' may be made available." With the facts that may thus be brought distinctly before the public, it may soon become generally understood whether Professor House's *Letter Printing telegraph* (the only American telegraph patented in Great Britain and other European kingdoms as well as in the United States) is any infringement of Prof. Morse's patent, or of anything which Prof. Morse has a right to claim; and it will also be seen whether the telegraph system patented in the United States Patent office by Col. Charles B. Moss, of Virginia, under claim for a patent, (in the same way that Prof. Morse patented his "vital" "principle" as late as 1845-6) is or is not at least as original and effective as any telegraph that makes arbitrary signs like the dots and lines first used by Steinheil and by Davey in 1837 and 1838, and afterwards combined by Prof. Morse in his first patent of 1840. It may then also be seen whether any one of the above named inventors had any exclusive right to a monopoly of the "general principle," which authorizes her agents to dictate terms to the others; or whether it is requisite for the American people, who desire to use either of the telegraphs, to crave permission from the holder or controller of any one patent, before they can use the improved and different system covered by another patent, as in the case of Morse and House.

"That the public generally shall have ample guarantee for the BEST MODES of telegraphing which AMERICAN INGENUITY has yet devised, the right to use three different systems has been secured by me, to the end that no delay or difficulty need ever occur from relying exclusively on any one mode of telegraphing upon the lines constructed through my agency."

This is the declaration under which I have constructed and am constructing the lines of the "Atlantic, Lake and Mississippi telegraph," since we crossed westward of the Ohio; and while my associates and myself are willing to fulfil contracts as far as Morse's telegraph is used, it is desirable to ascertain whether or not we can be debarred from securing for the public along our lines the benefits which any other Telegraph system affords—especially as the associates of Professor House, conscious of the originality and value of his "Patent Letter-Printing Telegraph," and unawed by the denunciations fulminated against them, have signified their willingness to try titles with the controllers

of Morse's Patent, (in the Courts or by Arbitration, under any penalties that may be required,) for the purpose of determining which of the two inventions is most original in character—which Patent (if either) is invalid—and which mode of Telegraphing reflects most credit on American science and ingenuity—though it is but justice to say that some of the most competent judges in the Union, (such as Professor HENRY, familiar with House's as well as Morse's Telegraphs, declare that House's system does not infringe on Morse's.

In memorializing the Ohio Legislature last winter for right of way for our Telegraph Lines, I stated that, on the part of my associates, "there is no disposition to seek exclusive favors" for "any mode of Telegraphing," but that, on the contrary, "it is believed the permanent interests of the Telegraphic system, as well as of the public, would be promoted by granting facilities impartially to all individuals or companies who have confidence enough in any Telegraph system to induce them to bestow their efforts and their money for its advancement"—"my associates, as well as myself, believing that the best security for the best system of Telegraphing will be found in throwing open the doors for free and honorable competition—any thing like monopoly or favoritism being as contrary to the real interests of the Telegraph system generally, as it is repugnant to the doctrine of 'Equal Rights.'"

Willing as heretofore to secure to each inventor all that the respective contracts call for, in the different regions covered by different contracts, it is a matter of some interest to the public, as well as to my associates, to know how far any one of these of other inventors, or their Agents or controllers, can arrogate to themselves the right to denounce all others who use a different Telegraph system without their "permission."

The importance of the subject, growing with the extension of the Telegraph system through the Union, renders it desirable that the public should have the facts in a comprehensive form for the popular judgment; and it is hoped that the statements now invoked will aid in guiding the community to proper decisions.

In this important enterprise, it will probably be found that PUBLIC CONFIDENCE is more potent than Legislation or Monopoly in extending and protecting that mode of Telegraphing best calculated to promote "the greatest good of the greatest number."

The Essays to be addressed, under seal, within ninety days, to the care of Henry E. Spencer, Mayor of Cincinnati; N. W. Thomas, President of the City Council; and James C. Hall, President of the Chamber of Commerce; to be by them handed over to a committee of distinguished scientific men, either in the Eastern or Western Cities, who shall award the Premium within twenty days thereafter.

In behalf of associates in the Atlantic, Lake and Mississippi Telegraph,

HENRY O'REILLY.

Cincinnati Exchange, Sept. 1, 1847.

### Should the Government own the Lines of Telegraph?

This question has been often asked, and answered in very different ways. The following article from the Scientific American, is to the point, and mainly in accordance with our own views, as far as it goes; but we go for enterprise and competition, and not for government, or company monopoly.

It has occurred to us, and so we have before said, that a line of substantial and permanent posts might be erected along the principal railroads, by the Railroad Company, on which numerous lines of wire might be placed and operated by different individuals, and in competition with each other; the whole to be kept in order by the Railroad Company, for which they should receive a share of the profits, or a stipulated annual rent. We, however, do not aim to lead, or dictate, in this matter—but to suggest, and communicate the views of intelligent men, who see a greater good in this important matter than the interests of a few individuals.

It has been by many recommended that Government should purchase the exclusive right to the magnetic telegraph, thus monopolizing the right of all telegraphic communication; and in view of some advantages to be derived from such an arrangement, we have felt inclined to favor it; but in view of the rapid extension of lines in various directions by individual enterprise, we are led to consider in a more serious light many objections to having the excellent facilities of telegraphic communication controlled by, and dependent on, a party favoring secretary or commissioner. It is true, that a considerable portion of the business of the Post office department is likely to be superseded by the increasing facilities of telegraphing; but then the public will be incomparably better accommodated under a system of competition, than with a government monopoly. For example, supposing the telegraphic system to be under the control of Government, if a branch line were wanted to be extended to a village at a short distance from a main line, a similar obsequious and tedious process must be performed to obtain the privilege that is required now to procure the establishment of a new mail route: and to every such branch line the deputy agent at the junction of the proposed branch with the main line, would be very likely to be opposed. We have already an example in the case of the Washington and Baltimore lines, to show that under the special control of government, favorites with extravagant salaries will be employed as superintendents, though, perhaps, less capable and attentive than others who might be employed by private companies at one-fourth the amount of salary. Moreover, the nature of the telegraph system is such as to require frequent extra exertion in forwarding messages to individuals, whether a ready and ample compensation was certain or otherwise; and this would be done, under a competition system, in view of the popularity of the line; but under a general government system, the agents or superintendents would feel and act more independently of any consideration but that of their responsibility to the department. And even the general system of management under the acts of Congress, and instruc-

tions from the post-master general, or other head of department, would not, in any probability, be so judicious, and consistent with the productiveness of the establishment and accommodation of the public, as under the control of men of more experience, and consequently better judgment, in practical business operations: for a man must be blind indeed, who cannot see that members of congress—a body composed principally of lawyers—have less knowledge of the ordinary business operations and requirements of the community, than a great majority of their constituents. Another consideration to be examined is, the probability that the government would be inclined to restrict the telegraphic facilities in favor of the post-office and mail operations, by the same rule that our state legislature has cramped and restricted railroad facilities to favor the more expensive and tardy operations of the canals. Government may, if it pleases, impose a tax on such telegraphic communications (or on those uttered verbally) as might be construed to be "mailable matter;" but the effect of such an act would be in a great measure proportionate to public sentiment with regard to the constitutionality thereof; but intelligence, like water, will constantly tend to flow in its most convenient channels.

#### Eastern Railroad.

##### Twelfth Annual Report.

We have received a copy of the twelfth annual report of the directors of this company. It shows a fair increase of business, both in passengers and tonnage. This company, like many others, is building, and aiding others to build branches to the adjoining towns, by which the business of the main stem will be materially increased. The number of way passengers on this road is very great. The number stopping at, and short of, Salem, probably exceeds three hundred thousand.

In laying the second track they have adopted the longitudinal sill, prepared after Kyan's process, by which, and Herron's experiments, we shall, in due time, be able to judge of its utility, or advantage, in the superstructure of railroads.

#### Report of the directors to the stockholders of the Eastern railroad, at their twelfth annual meeting, July 12, 1847.

GENTLEMEN: The directors beg leave to submit the following

##### REPORT.

During the past year a revision and new classification of all the accounts and expenditures of the company, for the construction and equipment of the road, have been made with all practicable precision, the results of which, in a condensed form, and brought up to the 30th ult., are given in statement No. 1 herewith submitted, and from which it appears that the actual cost of the road from Boston to the line of the State, (the limits of its charter,) 38 miles, 1063 feet, and of the branch to Marblehead, 3 miles, making a total of 41 miles, 1063 ft., has been \$2,022,378 78—or \$49,085 52 per mile.

The equipment for operating this and the Eastern railroad in New Hampshire, making a total distance of 57 miles 1076 ft., has cost in addition, \$233,577 51—or \$4,063 20 per

mile: making \$53,168 72 per mile; and total outlay, \$2,255,956 59.

Of this amount it will be seen by statement No. 1, that \$53,657 53 was expended during the past 12 months, viz: nearly \$5000 for old claims never adjudicated till this year—\$4500 for alterations in Newbury bridge, for which the company have a strictly equable, though probably an unavailable claim on the State treasury—and upwards of \$45,000 for additional engines and cars required by the increased business of the road.

In addition to the outlay thus stated, of \$2,255,956 59, disbursements have been made on several unfinished accounts, as follows:

**Gloucester Branch.**—The road bed of which is completed, and about six miles of the superstructure laid down. The floods and drought of last year in Maine, and the late period to which the rivers were closed by ice the present spring, have materially delayed the construction of this work. It will be opened this month to Manchester, and as soon thereafter to Gloucester as the rails can be laid. The particulars of the expenditures to the 30th ult., are given in statement No. 2, and amount (including interest to 30th ult.) to \$192,997 17. The length of this road is 13 miles 537 feet. Maximum grade, 45 feet—shortest curvature, 1350 feet—aggregate length of bridge, 3308 feet.

**Salisbury Branch.**—The grading is completed, and the road ready for the rails, which will be laid this season. The outlay therefor is shown by statement No. 2, and amounts (including interest to 30th ult.) to \$26,873 41. Its length is 3 miles, 4112 feet—maximum grade, 41 feet—shortest curve, 1632 feet—aggregate length of bridge, 201 feet.

**Second Track.**—This account, items of which are shown by statement No. 3, comprises all grading and raising of the road bed, the timber and expense of kyanizing it, and all materials and labor used in the construction of a second track, and the renewal of the old track, between Chelsea and Salem, except the iron rails. In doing this, a new system of supporting rails has been adopted, by which they have a continuous bearing on kyanized timber, which while it certainly gives a more easy and agreeable motion to the trains, and consequently diminishes the usual wear and tear, will it is believed, cost much less for repairs, be stronger under equal weights, less liable to accident, less dangerous if the engine or cars be thrown off the track, and far more permanent than the ordinary plan—especially if the process adopted for preserving the timber should prove successful. Its cost is not exactly ascertained, but will not probably be beyond that of the old method, except for the preservation of the wood, which will be about 7½ cents per cubic foot; when completed a portion of the expense will be chargeable to renewal account, and the balance to construction. The outlay to this time has been, per statement No. 3, \$44,666 31.

**East Boston Improvements.**—These consist in the reclaiming from the sea, of about 112,000 square feet, and the erection thereon of an engine house 110 feet square, of a ma-

chine shop, 90 by 82 feet, car houses and repair shops together, 60 by 250, and a freight house, 375 by 45. All these were imperatively required to accommodate the increased machinery in use, and when completed will save both in the amount of labor required, and the shelter which will be afforded to the engines and cars, for the accommodation of which the old buildings were entirely inadequate. The quantity of land over which these are now spread, exceeds 70,000 square feet—all of which will be made available, and the adjoining lands will become more valuable in consequence of the alteration.—The expenditures on this account have been, per statement No. 3, \$68,339 91.

**Salem Depot Improvement.**—The increase of the number of passengers taking and leaving the cars, at this station, have increased from 280,000 when the first accommodations were put in use, to 360,000, the past year, and the number of trains coming into and departing from it, raised from 20 to 60 daily, with the prospect of a large increase from the branches in progress, and the extension of the Essex railroad, will fully justify the policy of erecting the large and solid structures that are now in progress. Every effort will be made to complete them the present season. The expenditure has been, per statement No. 3, \$13,814 30.

**Railroad Iron.**—This account shows the quantity of rails that have already been purchased, appropriated to the new tracks between Salem and Boston—the old iron taken up being for the branches, 1200 tons—cost \$97,640 95; 770 tons are contracted for with H. Gray & Co., 400 with Bailey Bro., Liverpool, and will complete the amount required. When the works for which this and the old rails are intended, are completed, this account will be adjusted by a transfer to them.

The whole expenditure therefore of the construction of the Eastern railroad, its equipment, and unfinished accounts relating to the same, has been to this time, statement No. 4 \$2,700,308 64.

To this is to be added the several property accounts, as follows:

**E. Boston lands,** per statement No. 5, consisting of 180,570 square feet of land, \$45,445 30.

**Boston depot estate,** consisting of the ferry landing, land adjoining the depot, and wharf rights, No. 6, \$91,769 36.

**Sundry estates** per same statement, \$7,350.

**East Boston ferry and lands,** consisting of one half the ferry and 140,000 square feet of land in East Boston, No. 7, \$35,596 22.

No settlement of this account has taken place as yet with the owners of the other half—the East Boston company. Considerable improvements are in contemplation, which will absorb any funds there may be on hand. The treasurer of this company holds \$6000 of them on account, and subject to future settlement.

**Portsmouth bridge stock,** 200 shares, No. 8, \$32,000.

**Notes receivable,** No. 9, \$28,530 50.

**Mem. check, P.R. & P.R.R. Co.,** \$20,661 03

This has been received for the company's

interest in the steamer Hugtress and wharf at Hallowell—transferred.

**Sundry accounts,** per treasurer's trial balance, No. 10, \$6,386 73.

**Loan to Essex railroad company,** No. 11, \$66,110 17.

**Due from Horace Gray & Co.,** on account, No. 12, \$16,025 47.

**Income July and December, 1847,** for stock on hand, No. 13, \$23,990 48.

**Balance of freight and rents not received** on 30th June, \$15,046 03.

**Total,** \$3,080,129 03

The receipts to meet the above expenditures have been—

**Capital stock issued,** 22,500

shares, \$100, \$2,250,000 00

**State scrip,** 500,000 00

**Sinking fund,** per statement 14, 84,134 34

**Renewal fund,** " 20,987 17

**Income account surplus,** " 16, 30,283 03

**Notes payable,** " 15, 69,255 00

**Bank balances due,** " 15, 11,436 86

**Sundry accounts,** " 15, 13,732 63

**Dividend,** " 16, 109,300 00

\$3,088,129 03

**Teaming Establishment**—was instituted in September, 1844, and has now been in operation 34 months: its object was to facilitate the transportation of merchandize between the city and the East Boston depot, at as moderate rates of truckage as charged to other depots in Boston. This object has been accomplished, and the result now is, notwithstanding, or rather, perhaps, in consequence of the abused ferry, a net profit, as per statement No. 17, \$6,851 39. These accounts have never been, and are not now, included in those of the Eastern railroad company, but the above sum is invested in teams and furniture at a low valuation, and in a loan to the Eastern railroad company, and in cash.

**Eastern railroad in New Hampshire,** cost \$403,573 68. Number of shares, 4825.

The following synopsis of the past as compared with the preceding year, shows as favorable results as could be expected.

	Year ending June 30, 1846.	June 30, 1847.
Receipts from passengers.....	\$296,161 83	\$323,960 02
" merchandize.....	39,330 66	46,345 15
" mails.....	2,305 25	8,945 13
" incidentals.....	3,586 94	463 29
<b>Totals.....</b>	<b>348,384 68</b>	<b>379,713 59</b>

1847.....	30,388 03	

No. of passengers carried.....	735,452	780,774
No. tons merchandize.....	34,215	40,499
No. miles run by passenger and freight trains.....	219,054	236,700
Expenses per mile, do.....	56,504	53,899
No. passengers carried one mile.....	13,281,028	
No. tons merchandize carried one mile.....	1,156,229	

Notwithstanding the dividend on 4500 new shares, amounting to \$18,000, is deducted from the earnings of the last six months—more than was taken from those of the corresponding six months in 1846, there remains a surplus of \$1,658 90, against a deficiency last year of \$10,449 93, or a difference in favor of this year of \$12,108 92.

The result of the whole year 1846-7, as compared with that of 1845-6, shows an increase of income from the earnings of the road of \$31,328 91. Increase of expenses, \$3,964 99, or a net increase of \$27,363 92.

When the Gloucester and Salisbury branches shall be put in operation, and the Essex railroad be extended to its proposed terminus, still more favorable results may be anticipated. To accommodate this actual and expected increase of business, the considerable addition to the equipment, before alluded to, has been made.

For mutual and public convenience an arrangement has been made with the Essex railroad company, for working that road, charging therefore the actual average expense per mile of both. This has been done since that road was opened January 19, 1847, and trains have been run thereon to the 30th ult., 4670 miles, for which this company has charged at the rate of 50 5975 cents—in all 2,363 91—having carried 30,777 passengers. Between 60 and 70,000 dollars of the sinking fund has under the terms of the same agreement been loaned to this company.

During the past year, one person attempting to get into the cars, fell and lost an arm, two children have been struck by the engine on the road, one of whom was unfortunately killed; three men attached to the gravel train were wounded while sitting on the side of cars in passing some other cars, on a side track: but of the passengers, nearly 800,000 carried in the trains, not one has received the slightest injury.

By an act of the legislature passed the last session, this company were authorized in conjunction with the Boston and Maine railroad company, to lease or otherwise contract for the use of the Portland, Saco and Portsmouth railroad, and this act having been accepted by the stockholders of both companies, an indenture by which that road is to be operated and kept in repair by them, and the income over 6 per cent. to the stockholders, has been executed, and is mutually satisfactory and advantageous.

Another act was passed by the last legislature, authorizing this company to subscribe to the stock of the Grand Junction railroad and depot, and has been also accepted. Negotiations are on foot in relation to this matter, and it will no doubt be determined at a very early day.

To meet the expense of the company for increase of equipment, branches, etc., a new issue of stock, to the extent of 4500 shares,

was made in September last, and the whole taken, mostly by stockholders, at par. These shares were entitled to interest to the 31st of December, and to the regular dividends thereafter, and payments on them have been made in conformity.

Since our last annual meeting, it has been our misfortune to lose one of our board of directors, AMOS BINNEY, Esq., by death. To the strong discriminating mind, the intelligence and practical good sense of this gentleman, his associates have been indebted for much assistance and the company for many valuable services. To supply his place, there will be offered for the consideration of the stockholders, the name of a gentleman, whose high standing in the community, whose acknowledged probity and intimate acquaintance with and uniform advocacy of the interests of this corporation, as well as the relation he bears to it, as president of the Eastern railroad in New Hampshire, eminently qualify him for the position proposed.

The directors are not aware of any other than the ordinary business of the annual meeting, to which to call the attention of the stockholders, and trust that the preceding statements of the conduct and income of the road, will prove satisfactory.

All which is respectfully submitted.

D. A. NEAL, President.

#### Great Britain Steamer.

We find the following remarks by the Editor of the London Mechanics' Magazine, in the number for August 28th, in relation to "the plan of the Messrs. Bremner" for getting this noble ship out of her birth in Dundrum Bay. At the time of writing the article it seems that the object had not been accomplished, and there was some doubt as to the success of the plan adopted. Yet they were successful, and the ship was removed safely to Liverpool, or rather Birkenhead, for repairs.

The description here given of the mode of operation, may be interesting to those of our readers who do not see the English Magazines, therefore we give them entire—including, also, those relating to the 'Gorgon Steamer of 1100 tons burthen, stranded in Montevideo Bay in 1814."

For several months past the public attention has been kept alive to the fate of the unfortunate *Great Britain*, by paragraph after paragraph describing the progress of certain operations for raising and floating her, which were going on under the direction of Messrs. James and Alexander Bremner, C. E. (all former plans having failed), and which it was confidently predicted would result in the most complete success. All was said to be ready for lifting her on the 13th of July last; and on that day the attempt was made, but failed. On the 14th instant a second attempt was made, and that also has failed. We may now, therefore, be excused for inquiring into the causes of these failures, in order that it may be seen whether the means adopted have been the most judicious that could have been used for the purpose; and whether there really is any such difficulty in the case, as thus, apparently, to set all the engineering skill of the country at defiance.

The plan of the Messrs. Bremner, as de-

scribed by themselves in a communication to the *Illustrated London News* of the 21st August, (which contains some excellent engravings, showing the several stages of these operations,) was as follows:

"First, twenty large boxes were made, to contain upwards of thirty tons of sand each. Ten boxes were suspended on each side by strong chains, which went over pulleys in the upper part of large vertical baulks of timber, the same chain passing through pulleys attached to the side of the ship, thus doubling the weight of sand in the boxes, less the friction; and, it should be added, those boxes in the middle of the ship, opposite the engines, had four powers to each, to prevent straining the ship at that part. Very powerful levers were put to the fore-end, capable of lifting about 190 tons; and, along the sides opposite the large timbers, formerly on the ship, were also placed levers, capable of lifting about 200 tons each. In addition to the lifting power of boxes and levers, was applied screw power, capable of lifting 100 tons. These screws were placed near the hawse-holes, on a stout frame of timber, which was on immense end-wood supports. The levers on the sea side of the ship were ballasted with chains, anchors, and parts of the engine: as also were those on the fore part. The sea had, therefore, little surface to strike against; while the levers on the land side of the ship were ballasted by a large iron boat filled with sand."

From this description it will be seen that, with the exception of the 100 tons of screw power employed, Messrs. Bremner relied on raising the vessel by dint of mere strength or weight alone. How they calculated the weight to be raised, or resistance to be overcome, or whether they made any calculation at all, is not stated; this only appears, that, by suspending weights here, and by suspending weights there, amounting in all to about 2000 tons, they expected to start the vessel from her sandy bed. Anything in the way of engineering less skilful or scientific than this, it would be difficult to imagine. However, according to the Messrs. Bremner, the mechanical force they employed—whether hit upon by chance or calculation—was actually sufficient for the purpose. We quote again their own words:

"When the lifting power was about complete, on the 13th of July (spring tide), it was thought advisable, as the good weather was passing, to make the first attempt: when, to the surprise of all on board, the ship lifted so rapidly, that the valves had to be opened to prevent her going up farther. (!!!) The first trial was set about too prematurely, as sufficient preparations had not been made to retain the ship at the required height; consequently, on the receding of the tide, several of the boxes and baulks were injured."

The thing was done, only it had to be undone! Trying to raise her, she rose so rapidly that they were obliged to open the valves, and let in the water to sink her again! So swift was the ascent to the surface of the water, that it was necessary to water-log her, to "prevent her going up any farther" (!!!)

(How much farther did they think she might have gone?) No "sufficient preparations" had been made "to retain the ship at the required height," which means, we presume, to keep her afloat; and to provide, therefore, against her sinking again, *sua sponte*, it was thought well to sink her beforehand, *a la noyade Francaise!*

Rendered into plain English, and real matter of fact, we take the statement which we have quoted to mean simply this: The engineers had thought only of what weight against weight would achieve, and taken no heed of what was to become of the lighter weight after it was raised; the vessel was started from her bed, but filled almost immediately with water, through holes in her bottom, and consequently sank again to her original position; while the weights, reeling under the great effort they had made, were some upset, and some injured, and all lowered into the mud. Another notable specimen this of engineering! The rudest of heavers could not have managed worse.

To provide against a like disaster on the second attempt, the following arrangements were made:

"Some thousands of small piles were driven, reaching from the surface of the sand to that of the rock; and on these piles were laid foundations for vertical supports, which, by an ingenious contrivance, were made self-acting, so that as the ship rose the shores placed (were intended to place?) themselves. In addition to these shores, were many immense wedges, hauled in at the fore-keel and bilges; stone were also put under her with long shutes from the deck."

The second attempt, however, (August 14,) proved so much worse than the first, that the efficiency of these arrangements was not put to the test. The vessel this time was not moved at all. The tide did not rise high enough. "No tide," says Captain Claxton, "only 6 feet 6; we want 13 feet 6; and tide-table gave it." They (Messrs. Bremner) have been beat this time by the elements.

That the same weights which lifted the vessel "so rapidly" on the first occasion should not have been able to move her at all on the second, is, it must be confessed, somewhat strange—the "elements" notwithstanding; and the only way in which we can account for it (without impeaching the veracity of the account given of the first experiment, which we see no reason for doing) is, that the vessel must, between the two attempts have imbedded herself in the sand more deeply than ever.

A third attempt to raise the vessel is, it seems, to be made in the course of a few days, when "very high spring tides" are anticipated.

We will not go so far as to say that there is no likelihood of success; for as long as it cannot be gained that a weight of 10 lbs. will raise one of 5, there is no doubt that the thing can be done in the way Messrs. Bremner propose. But this we will unhesitatingly affirm, that if she ever is raised, it will not be by means of any ingenuity, skill, or sci-

ence which these gentlemen have brought to bear on the task. A vulgar reliance on brute force is the broad feature of all their contrivances; they rely on it to raise the vessel, and they rely on it to keep it up when raised. Of the aids which hydrostatics and pneumatics offer for the purpose, they are manifestly in most deplorable ignorance.

The owners of the *Great Britain* have spoken somewhat sneeringly on several occasions of the number of schemes for saving her with which they have been "pestered." We once thought them ignorantly supercilious on the matter; but if we may take it for granted, that the plan of Messrs. Bremner was the best of the lot, we must needs confess that they judged shrewdly enough. Was it really, however, the best? Or did they prefer it simply because it was more in conformity than any other with their own notion of the mechanical powers? We should not be greatly surprised if the latter supposition were the truer one of the two.

We know nothing of any of the schemes submitted to the Directors of the Great Western Company, and do not now speak disparagingly of the operations of Messrs. Bremner, with the view of favoring any of them. In what we have to say farther on the subject we shall confine ourselves to plans which were prepared and put in successful practice long before the *Great Britain* was wrecked in Dundrum Bay; and rest content with asking in conclusion, why the same plans should not have been followed in the case of the *Great Britain*, and should not now (supposing attempt the third fail) be had recourse to?

In 1828, Mr. John Milne, of Edinburgh, published a work entitled "Plans for the Floating of Stranded Vessels, and for Raising those that have Foundered, with an Improved Method of carrying Vessels over Banks and Shallow Water." An account of this work was given in the *Mechanics Magazine*, vol. xx., p. 835. Mr. Milne proposes to employ in various ways the power of vessels, or buoys, filled with air (*not sand*) to raise stranded vessels:

"While it is yet low water, let a number of these buoys (or light leather bags) in a perfectly collapsed state be stowed away about the cabin of the wreck, in its hold and steerage, and let them also be confined down near to the bottom of the shattered ship, by cross and upright spars, butting against the under side of its deck; and let an injection pipe communicate with the blowing-pump within the steam-vessel (salvage vessel employed for the occasion,) which may, during the operation of filling these buoys, be at any convenient distance from the wreck. Let the blow-pipe now begin to act, by which the buoys will soon be filled, and the wreck will float off when the tide has risen to a sufficient height; for the buoyant effect of the volume of air placed within these envelopes is equal to the weight of a mass of water of the same magnitude; and since the weight of a cubic foot of sea water is a little more than 64 pounds avoirdupois, it does not seem to require the injection of many cubic

feet of air to be equal to the weight of even a large wreck while in water, which, being afloat, may now be towed into port by the steam-vessel; and when on its passage, if it were found that the air escaped from its envelopes, they might be kept perfectly full by the air-pump continuing to discharge a sufficient supply into them by the communicating pipe already mentioned."

The reader will be instantly struck by this remarkable feature of the plan of Mr. Milne, that the same power which is employed to raise the vessel serves afterwards to *keep it afloat*, and to carry into port; while the plan of Messrs. Bremner provides but for raising the vessel and leaving it where it was—liberated only from its hold on the shore.

In 1833, Dr. John Hancock recalled attention to this mode of raising vessels, in a communication to the *Mechanics Magazine*, vol. xx., p. 170, and strongly urged its general adoption.

Not many years later we heard of some thing like it having been actually adopted in several instances with great success by Mr. Bush, the ingenious, enterprising, but most ill-used constructor of the "Light for All Nations." The first case was that of the *Nimble* cutter which was wrecked in October, 1837, on the Corton sands; and another, that of the *Blucher*, which sunk in three fathoms of water off the Naze; both of which vessels Mr. Bush succeeded in raising and carrying into port. Mr. Bush's plans differed from Mr. Milne's chiefly in this; that he made use of empty casks and hollow cones, instead of flexible air-buoys, and had, consequently, all that trouble to encounter which it was Mr. Milne's object to obviate, namely, the great trouble inseparable from every attempt to attach a number of rigid hollow bodies to a vessel under water.

We would not have our reader to suppose, from what we have said, that we mean to represent the employment of air-vessels for raising sunken vessels as dating from the publication of Mr. Milne's book. The fact is not so. Empty casks had been employed, in one way or another for the purpose, time out of mind; and camels (the invention of the Dutch), which differ but in bulk and shape from casks, had also been known for a century and more. Mr. Milne himself states that he was well aware of these contrivances, and aimed only at improving upon them. What he did was to suggest the employment of flexible, instead of rigid air-vessels; the attachment of them, in a collapsed state, to the vessel, both inside and outside; and the inflation of them with air after they are so attached. Most valuable suggestions these were, and, according to the best of our knowledge, perfectly original.

The progress of the arts since the date of Mr. Milne's book, has tended greatly to enhance the value of his plans. Caoutchouc was then unknown, except as a material for rubbing out lead-pencil marks, (*unde derivatur INDIA-RUBBER, Angl., LEADEATER, Scott.*); and well greased leather was the best material Mr. Milne could think of for making his flexible bags. But now that caoutchouc has

come to be employed so extensively in the sheet state, and in a state of solution, to the manufacture of air and waterproof elastic fabrics,—now that air-balls, and air-cushions, and air-beds made of, or with the aid of caoutchouc, are become articles in common use,—the ship salvor has at his command a material incomparably superior to leather, and one with the aid of which he may carry out Mr. Milne's views with a facility far beyond what the inventor himself could ever have anticipated. Caoutchouc bags contract and expand, which leather bags do not. Caoutchouc bags may be made perfectly impermeable to both water and air, which leathern never can. And caoutchouc bags may be stowed away in a tenth of the space which would be required for the others. A very small cabin would suffice to hold as many caoutchouc bags as would raise the biggest ship that ever floated.

The Americans have in this, as in not a few other instances, been quicker than the English to appreciate the advantages of employing caoutchouc bags in the salvage of ships. We quote the following notice from a recent number of the *Baltimore Sun*:

#### "Marine Camels."

"We on Monday witnessed an experiment made at the U. S. receiving ship Ontario, of the power of the marine camels, the invention of Captain Taylor. The camels are simply India-rubber canvas bags, made so as to retain all the air which may be pumped into them. They may be placed under any vessel which it may be desired to raise out of the water, and in proportion to the amount of air forced into them, the ship will rise. The sloop of war under which the camels had been placed, was raised three feet in less than one hour and a half; the camels, if we may use the expression, being fed by a small air-pump, worked by but one set of hands. It was evident, from what was done, that she might have been raised, with sufficient power, we may say, almost out of the water. The design of this invention is to carry ships over bars, or to relieve vessels which may ground on a bar."

Why should not the directors of the Great Western Company (the owners of the *Great Britain*) go and do likewise? If Messrs. Bremner succeed in their third attempt—which we have admitted to be a *possible case*—there will be no occasion to call in other aid; but if they fail once more, as is likely enough, the directors will be inexcusable if they do not have recourse to the well-tested and infallible means which we have here brought under their notice.

Before laying aside our pen, it may not be out of place to add a word or two with respect to another great wreckage case which, two years ago, excited nearly as much sensation as that of the *Great Western*. We refer to the case of H. M. steamer *Gorgon*, of 1100 tons burthen, Captain Hotham, commander, which was stranded in the Bay of Monte Video, May 10th, 1844; and after upwards of five months of incredible exertion on the part of her officers and crew, restored, nearly uninjured, to her native ele-

ment. A "Narrative of the Recovery" of this vessel has been published by Commander Astley Cooper Key, one of the lieutenants of the *Gorgon* at the time of the disaster, which, though written more particularly for the information of members of the author's own profession, is deserving an attentive perusal by all who are, or may be, in any way concerned in the salvage of vessels. The fertility of invention evinced by Captain Hotham on the occasion, the ingenuity and frequent originality of his plans, the sagacity with which difficulties were foreseen and provided against, the judgment with which orders were given and cheerfulness with which obeyed, and the unflinching energy and perseverance displayed by all concerned, from first to last, have found in Commander Key a faithful and most agreeable chronicler. Although we cannot cite the *Gorgon* as an instance of a vessel saved by this sort of agency we have been recommending (for she was saved chiefly by shore purchases and screws), yet we can cite both her commander and the writer of the "Narrative," as bearing unqualified testimony to the superiority of that agency over all others. Captain Hotham did, in fact, have recourse to the use of camels, and derived great assistance from them; but, owing to an accident, described in the following interesting extracts, they were put *hors de combat* before the ultimate rescue of the vessel by other means:

"This day's experience (22d August) was bitter; it showed clearly that the general means adopted were inadequate to the accomplishment of the undertaking. The camels were our only resource. The advantage of the camel in reducing the draught of water, especially in a case like the present, is so obvious, that the inquiry would naturally suggest itself, why were they not earlier thought of, and brought into use? This is easily answered; in the first place, economy required that the means which were considered adequate, should be *proved* not to be so, before others were resorted to; and secondly, the excavations in the dock were only now sufficiently advanced to admit them."

"On the 16th of September, at about mid-day, a sudden squall from the southward caused the water to rush into the bay with such force as to raise it three feet in a few minutes, bringing it therefore on a level with the top of the camels. When the camels were totally immersed, and were exerting their whole power, they had the immediate effect of bringing the ship upright."

"We had been assured that after October, all hope of any extraordinary rise of tide was at an end; from the commencement of that month, therefore, every indication of a southerly gale was watched with increased anxiety; we considered ourselves in every way prepared, our only daily employment consisted in the continued excavation of the dock and channel, which would admit of no cessation. At any ordinary rise of water, to the ten-foot mark, for instance, the ship was

evidently quite alive abaft, the slightest swell setting into the bay was sufficient to cause the immense power of the camels to be immediately perceived, by the motion they communicated to the ship; if either of them on one side sprung a leak, which occurred once or twice, the ship instantly lifted over two or three degrees to that side, and again righted when the camel was repaired and pumped out dry."

"Before relating the account of our final happy release, let us pause, to remind the reader what power was at the present period applied, after all the changes and alterations had taken place, and which have been so confusedly recounted in the preceding pages. And, first, as to the lifting power, or that applied to lessen the ship's draught of water: The amount of this is easily ascertained; but the actual effect, that is to say, the exact reduction, is not so simple in the attainment: the investigation would involve more delicate and abstruse calculation than is consistent with the character of the publication. The form of the ships bottom, her exact displacement, and other data, would also be necessary, before any result, in the slightest degree approximating the truth, could be obtained. Let us therefore be content with the mere amount of power, which may be tabulated thus:

Port side. Tons.	Starboard. Tons.	Astern. Tons.
Camel (1) 56	Camel (2) 64	Caisson 5
" (3) 63	" (4) 49	
" (5) 76	" (6) 66	
Boilers.... 10	Tanks.... 14	
16 Pipes.... 8	10 Pipes.... 5	
213	198	

#### Summary.

	Tons.
Port side.....	213
Starboard side.....	198
Astern.....	57
Total.....	468

Showing a total of 468 tons directly applied to reduce the ship's draught; and, from the description of power, every ton is clearly and inevitably available. There is no loss from friction, or bad material; no doubt as to the proper force being exerted, as is the case with animal power; the machines are in themselves helpless; they are forced to put forth their whole strength; and, as long as they are entirely immersed, there can be no relaxation or diminution to their exertions."

"The ship had been dragged her whole length when No. (1) camel slipped from its shores, and rising, the surf struck it heavily against the ship's side, by which it was stove; soon the whole of the camels followed its bad example; this was grievous indeed, but the ship was now entering the mud, and continued to move, though more heavily than before."

"The reason of the defection of the camels was very evident. The gripes, by which they were boused close to the ship's side, were made fast below the camels to the swifter; to this, at the stern post, was also secured the standing parts of the runners on

the heaving off cables; therefore, when these carried away, and were unrove, the swifter, of course, slackened: this gave the camels a little play, which was increased rapidly by the swell, and finally, so as to trip up the shores; they were then completely adrift."

"The ship was still imbedded four feet in the mud, which was now considerably softer than that nearer to the sand. But as we now were assured that she could be dragged astern by main strength, and at a little more than an ordinary tide, the intention of re-securing the camels and 'caisson' was, of course, abandoned."

The engines of the *Gorgon* were employed as the principal moving power in working the purchases and screws, and the author of the "Narrative" claims for Captain Hotham the merit of having been the first to turn to so useful an account what had previously been regarded as one of the greatest obstacles to the salvage of a vessel under such circumstances:

"I believe it may be with propriety assumed that a very general impression has prevailed in the navy, that one of the great difficulties attendant on officers commanding steamers would be, getting them afloat should any disaster throw them on shore. The necessity of removing the engines was always admitted; and the minds of naval men had been turned to simplify a process considered as a *sine qua non*. It was reserved for the *Gorgon*, a vessel with engines of 300 tons weight, to prove to the world that an officer should consider well his position, before he adopted too hastily a plan that would inevitably render his vessel at once unserviceable. As a matter of course, the advantage to be gained by their removal struck every one; but this was more than counterbalanced by the difficulties attending the operation, the expense to be incurred, and the probable loss or injury of many small parts, and more than all, by the declaration of the engineers that the resources at their command were not sufficient for their restoration and re-erection. Weighing well the advantages and disadvantages held out by either course, it was wisely determined to retain them, and employ them as the principal moving power; but, as is, and ever will be the case, when any new idea is started, public opinion declared against it, the folly and madness of the plan was in the mouths of every body; still Captain Hotham remained firm, in defiance of the entreaties of his friends, and the ill-repressed hints of other self-constituted critics. His determination was that the engines should remain on board, and be used as the principal power for transporting the ship."

We have quoted the preceding passage with a special view to its bearing on the case of the *Great Britain*. Should recourse be had to the use of air bags, a considerable power will be required to inflate them; and Captain Hotham's example shows that none better can be employed than that which the vessel's own engines afford.

## ASSOCIATION OF GEOLOGISTS AND NATURALISTS.

The 8th annual meeting of this association will take place at Bos on on the 20th inst. It will be attended by the most learned naturalists and geologists from every quarter of the Union, while some bright stars from the continent of Europe are expected to shed their light upon the meeting. Much and valuable information will be elicited. Dr. C. T. Jackson, who presided at the last annual meeting in New York, is, *ex officio*, the chairman, by the death of the lamented Dr. Amos Binney, of Boston, who was chosen by the last meeting, and has since died, while sojourning in the city of Boston. By the death of Dr. Binney the association has lost a most valuable and munificent member. He was a good naturalist, and took much interest in its success. It is hoped that a proper tribute of respect will be paid by the association to his memory. The time of holding the annual meeting renders it impossible to insure the attendance of so large a number of practical geologists and miners as would be desirable, for they are mostly engaged at this season of the year in their researches and pursuits in the field.—*Mining Jour.*

## FOREIGN LETTERS PATENT FOR INVENTIONS.

The following statement as to the cost of taking out patents in European countries may be useful to some of our readers. It would be still more so, if it explained the mode of proceeding in the application.

The regulations attending the taking out letters patent are so generally but imperfectly known, that we have been induced to glean together the following particulars as to those regulations in the various European countries with which the United States government has diplomatic relations. In England, any person, native or foreigner, may obtain letters patent; but, in case of a foreigner living abroad, the patent must be taken out in his behalf by some person resident within the United Kingdom, as "a communication from a foreigner residing abroad."

No British subject can patent in his name an invention which is the communication of another British subject, unless the inventor is abroad or deceased. For England, Scotland and Ireland, separate patents are required.—The term for which a patent is granted is 14 years. The average cost—England, £110; Scotland, £75; Ireland, £125; if two names there is an extra expense of about £17 10s., and for every additional name £12. When two parties appear to have hit on the same invention independently, it is the practice either to allow a patent to neither, or, if the parties can arrange matters between themselves, to allow a patent to be taken in their joint benefit. The cost of entering a caveat for England, Scotland and Ireland, is one guinea per annum each. Patents may also be obtained in most of the European States, but they should not be applied for until the one for England has been secured. In taking out a patent in the United States, the party has the exclusive right of doing so for six months after making his invention public in England. The following is the average cost of foreign patents:—Austrian and Italian

States, 1 to 15 years—5 years, £25; 10 years, £45; 15 years, £75. Bavaria, from 2 to 15 years—5 years, £12; 10 years, £15; 15 do., £20. In Belgium and Holland, patents may be secured without any tax for 2 years; thus giving ample time to prove the invention. If successful, the terms are then, 5 years, £23; 10 years, £23; 15 years, £50. If after two years he abandons it, there is no further tax or liability. By the new law in France, which came into operation October 8, 1844, a patent may be obtained in that country for 15 years, for £4 per annum, which may be discontinued at any time; if for 5 years certain, £21; 10 years, £37; 15 years, £70.—Prussia, 5, 6 or 8 years, £15. Russia, 1 to 6 years, £20 to £30 Spain, 5 years, £50.

In this country, patents are granted for 14 years—fee to the government, £30.

## AMERICAN RAILROAD IRON.

Rolling mills for railroad iron will soon be found in operation. The following paragraph speaks of one "in the woods," where a few years since only bears and wolves had their dens—but where now is found a busy population of several hundreds. We are now only just commencing our career in this branch of business. Ten years more and we shall be fairly engaged in it. The writer in the *Mining Journal* says—

The New York and Erie railroad company have contracted with the Lackawanna works Providence, Luzerne county, Pennsylvania, for 12,000 tons of rails, with which to lay about 77 miles of road, for \$800,000. The iron manufactured by this company is said to be far better than the imported—indeed the best that can be obtained in this country. Whether this be true we are unable to determine. These works are situated where, according to a writer who has visited them, "five years since there was nothing but an impenetrable ravine, in which bears had their dens, and disputed the right of territory with the inhabitants of the valley below."

On the side of this mountain glen, overlooking the beautiful and fertile valley of Lackawanna, which forms a part of the grand Wyoming coal basin, is now seen a village of some three or four hundred inhabitants, some fifty or sixty houses, including a church, stores, splendid mansions, all painted white, and presenting the appearance not only of "a city in the country," but of a city in the wilderness.

The Erie railroad is completed to Otisville, in Orange county, sixty-two miles from Piermont. In November, a further extension of twelve miles will be made to Port Jervis, on the Delaware. The whole distance to Lake Erie is 450 miles, of which 40 are in Pennsylvania. Between the present terminus and Binghamton, six or seven thousand laborers are employed; and west of that the grading, much of which was completed previous to 1842, is very easy, and will be done long before the iron can be obtained.

By reference to the receipts of this road for the month of August, it will be seen that the amount of business is rapidly increasing.—When completed, Chicago will be only two and a half days distant from New York; and when the railroad route shall be continuous,

via Toledo, the distance can be made in two days.

Reeves, Buck & Co., of the extensive iron works at Phoenixville, Chester county, Pa., have just contracted to furnish the iron required for the eastern section of the Pennsylvania Central railroad. The price stipulated for the iron, delivered on the road, is \$60 50 per ton. The Phoenix company is one of the most wealthy and enterprising in the country, having successfully withstood all the fluctuations of trade for many years.

## UPPER CANADA MINING COMPANY.

At a meeting of the American shareholders of this company, held at the Astor House, during the past week, G. S. Tiffany and James B. Stewart, of the Trustees, and H. B. Wilson, secretary of the company, presented reports of the proceedings of the company since its first organization, together with full exploration reports of the several locations already secured by the company, as also assays of the ores, etc., which proved full and very satisfactory to the meeting.

This company is now in full operation. They have secured four locations on Lake Huron, and also four on Lake Superior, of undoubted mineral wealth, on very favorable terms from the Canadian Government. One location in particular on Spanish River, Lake Huron, it is said, will fully compete with the celebrated Bruce Mine, on which the company has at present, under the direction of Col. Dibble, a working party, from which they have every prospect of being able this year to send to market considerable ore. On Lake Superior, they have also, under the direction of Carlos Cobb, Esq., the agent, men and tools, making still further explorations, with directions to establish working parties at once.

The object of the meeting, in addition to laying the above facts before them, was to take incipient steps to organize under their charter, as also to establish an office of transfer in this city.

The fiscal concerns of the company was shown to be very satisfactory. Sufficient funds are in hand to meet all the expenses of the present year, with a surplus to be applied in part on account of any assessment that may be required from the shareholders for the ensuing year, in case they should not be able to realize sufficient from the sale of ores, of which at present they have every prospect. Offers were made, very advantageous to the company, for all the surplus stock created by their charter.

It is the intention of the company, during the fall, to send an agent to Europe, to establish agencies, and make such other arrangements as will place the company, in addition to those already made, on a permanent footing.

The meeting, after passing a vote of thanks to their chairman, Ramsey Crooks, Esq., adjourned, highly gratified with the prospects and success of the company.

We have been promised extracts from the several reports, as also assays of the ores, etc., which we will take an early opportunity of presenting to the public.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.**  
Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

2m32

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 feet in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2300 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FIRES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**SPRING STEEL FOR LOCOMOTIVES, Tenders and Cars.** The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 8 inches in width, and of any thickness required; large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,

Albany Iron and Nail Works,

**RAILROAD IRON.—400 TONS ENGLISH,**  
60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

**DAVIS, BROOKS & CO.,**  
63 Broad Street, New York.

**FOR SALE—300 TONS (10 MILES) FLAT**  
Bar Rail, in parcels or wholesale—section 3 1/2 inches wide by 1 1/2 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

**L. R. TRIMBLE,**  
Wilmington, Del.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
**SHIPPING & COMMISSION AGENTS**

**PASSENGERS, SPECIE, GOODS, PARCELS, etc.**  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise,] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m **ROBERT GRACIE.**

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

41f

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by J. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja15

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by  
**JOHN A. ROEBLING, Civil Engineer,**  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

3v1917

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an Improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arrester have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Potomac Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad, W. R. M. Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad, Passaic, N. J.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

The letters in the figures refer to the article given in the Journal of June, 1844. ja15

**PATENT HAMMERED RAILROAD, SHIP AND Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

**JOHN P. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y.

The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriam, New York; J. H. Whitney, do.; E. J. Kitting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Paterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; saws, saws, callen-lers; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
445 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Spring-Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.  
Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trelis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trelis, is discharged immediately into the side ditches.

In the 6 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trelis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =		
68,696 ft. b.m., at \$10 =	\$686 96	
587 Oak joint blocks 2 ft. x 3 x 15 in. =		
4,403 ft. b.m., at \$13 =	57 21	
13,000 Spikes = 2,250 lbs., at 4½ cts. =	101 25	
Workmanship free of patent charge =	600 00	

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**

Civil Engineer and Patentee.

No. 377 South Tenth St., Philadelphia. 33f

## LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 11-1 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

25 Platt street, New York.

## RAILROAD IRON. MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address **J. M. HOWE,**

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

**ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,**  
Surviving partner of  
**STANCLIFFE & DRAPER.**

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

**THE SUBSCRIBER** has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

**ANDREW MENEELY.**  
West Troy, May 12, 1847. 1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**  
Vine St. Wharf, Philadelphia. 12f

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,** Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by **JOHN W. LAWRENCE,** 142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and in the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, &c. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LB. OZ.	INCH.	LB. OZ.		LB.	INCH.	
11	4	13 5	10	24 -	50	15-16		20
13	3½	9 3	8½	16 -	37	11-16		13½
14	3½	8 11	7½	13 8	17	9-16		10½

16	2½	4 3	6	8 8	10½	7-16		7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Elliccott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Elliccott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.  
1y25

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
**G. A. NICOLLS,**  
Reading, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

**W. H. CALKINS, and Others.**

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co. have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

**WILLIAM ROSS, Sup't of Power.**

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a

For simplicity of construction, economy in cost, lightness of material, and ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 8, 1845.

[Signed,] **G. A. NICOLL,**

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,]

**T. L. SMITH,**

Jersey City, November 4, 1845.

**N. Jersey Railroad and Transp. Co.**

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

**T**O LOCOMOTIVE AND MARINE ENGINE Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 8 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia 11f

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 281f

J. BALL & CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 9 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning train from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon train from Haverhill. At about 7 1-4 p.m., on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**LITTLE MIAMI RAILROAD.—OPEN**

**TO SPRINGFIELD**—Distance 84 miles—connecting at Xenia and Springfield with Messrs. Neil, Moore, & Co.'s daily daylight lines of stages going east and north, to Columbus, Zanesville, Wheeling, Cleveland, and Sandusky City, via Urbana, Bellefontaine, Kenton, and the Mad river and Lake Erie railroad, or Columbus, Delaware, and the Mansfield and Sandusky City railroad—forming, by these connections, the cheapest and most expeditious route to Buffalo, Niagara Falls, Rochester, Albany, New York, and Boston.

On and after Thursday, August 13, 1846, until further notice, a Passenger train will run as follows: Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Old Town, Yellow Springs, and Springfield.

Returning, will leave Springfield at 4 hours 35 minutes A. M. A line of Hacks runs in connection with the Cars, between Deerfield and Lebanon.

FARE—From Cincinnati to Lebanon	\$1 00
" " " Xenia	1 50
" " " Springfield	2 00
" " " Columbus	4 00
" " " Sandusky city	8 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

The 1½ P. M. train from Cincinnati, and the 2 40 P. M. train from Xenia, will be discontinued on and after Monday, the 10th instant.

A freight train will run daily.  
47d W. H. CLEMENT, Sup't.

25d Office 75 Courtlandt St.

**BALTIMORE AND OHIO RAILROAD.**

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with—the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$13. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. 313y

**BALTIMORE AND SUSQUEHANNA**

Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger

trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....9 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.  
Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**

Fare to York	\$1 50
" Wrightsville	2 00
" Columbia	2 12½

Way points in proportion.

**PITTSBURG, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburgh via stage to Harrisburg.....\$9  
Or via Lancaster by railroad.....10  
Through tickets to Harrisburg or Gettysburg.....3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owing's Mill, arriving at the Mills at.....5½ p.m.  
Returning, leaves Owing's Mills at.....7 a.m.  
D. C. H. BORDLEY, Sup't.  
Ticket Office, 63 North st.

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m. and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and 9 a.m. from Frankfort, other hours as above. 351y

**CENTRAL AND MACON AND WESTERN RAILROADS, Ga.—These Roads with the Western and Atlantic Railroad**

of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

	Miles.
Savannah to Macon—Central Railroad	190
Macon to Atlanta—Macon and Western	101
Atlanta to Oothcaloga—Western and Atlantic	80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings	To Atlanta.	To Oothcaloga.
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones	\$0 50	\$0 75

On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....0 20  
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....0 20 pr. 100lbs. 35  
Crochery, per cubic foot.....0 15 " " 35  
Molasses and Oil, per hhd., (smaller casks in proportion) 9 00 13 50  
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....1 25 1 50  
Ploughs, (small,) and Wheelbarrows.....0 80 1 05  
Salt, per Liverpool Sack.....0 70 0 95

Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R.

Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH**

to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally.....50 cts. per hundred.  
On measurement goods.....13 cts. per cubic ft.  
On brls. wet (except molasses and oil).....\$1 50 per barrel.  
On brls. dry (except lime).....80 cts. per barrel.  
On iron in pigs or bars, castings for mills, and unboxed machinery.....40 cts. per hundred.

On hhd. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd.  
On molasses and oil.....\$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston, on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tusculum Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tusculum.....22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tusculum, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAILROAD**

line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25d

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847:

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville,	92	\$3.50 and	\$3.00
" " Reading,	58	2.25 and	1.90
" " Pottsville	34	1.40 and	1.20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

# PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

## Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.

Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R.

Leave Philadelphia at 3 p.m. No line on Sun-

Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia &

Wilmington.—Philadelphia to Wilmington, 8 a.m.,

mail, 12 p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wil-

mington to Philadelphia, 7 a.m., 1 p.m., mail, 4 p.

m., 7 p.m., 12 p.m., night mail.

J. R. TRIMBLE,

2d Engineer and General Superintendent.

# GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO DALTON, 100 MILES.

This Road in connection with

the South Carolina Railroad and

Western and Atlantic Railroad now forms a continuous line, 408 miles in length, from Charleston

to Dalton (Cross Plains) in Murray county, Ga.—

39 miles from Chattanooga, Tenn.

## RATES OF FREIGHT.

	Between Augusta and Dalton.	Between Charleston and Dalton.
	97 miles.	408 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 18	\$0 28
2d class. Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.....	0 40	0 65
Cotton, per 100 lbs.....	0 45	0 70
Molasses, per hogshead.	8 50	13 50
" " barrel.....	2 50	4 25
Salt per bushel.....	0 18	
Salt per Liverpool sack.	0 65	
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows...	0 75	1 50

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad Co. will be forwarded free of commissions. Freight payable at Station.

F. C. ARMS, Supt. of Transportation.

Augusta, Ga., July 15, 1847.

## RATES OF FREIGHT

On CHANDLER'S Through Transportation Line, between Charleston, S. C., or Savannah, Ga., and Decatur, Ala., and Knoxville, Tenn., and all intermediate points on the Tennessee River, viz:

Between Macon and Decatur and intermediate points.	0 24	1 54		0 41	0 92
and Knoxville & intermediate points.	0 24	1 54	1 10	0 76	0 92
and Chattanooga.				0 61	
Between Augusta and Decatur and intermediate points.	0 24	1 70	1 15	0 86	0 90
and Knoxville & intermediate points.	0 24	1 70	1 20	0 80	0 90
and Chattanooga.				0 65	
Between Charleston or Savannah and Decatur and intermediate points.	0 32	2 30		1 03	1 10
and Knoxville & intermediate points.	0 32	2 30	1 40	1 00	1 10
and Chattanooga.				0 85	

1st class.—Boxes of Hats, Bonnets and Furniture per foot.....	
2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cans) Drugs, Confectionaries, Shovels, Spades, Scythes, Smiths' Bellows, Buckets, Tubs, Sifters, Brooms and other light articles, per 100 lbs.....	
3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheese, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casts, or Crates of Crockery, Hardware, and other heavy articles not enumerated below.	
4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Limestone Oil, per 100 lbs.....	
Per 100 lbs.....	
Cotton.	

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.; and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.  
Chattanooga, Tenn., July 1, 1847.

## REGULAR RATES BETWEEN ATLANTA AND CHARLESTON OR SAVANNAH.

First class, per foot.....	\$0 20
Second class, per 100 lbs.....	1 30
Cotton, per 100 lbs.....	0 55
Third class, per 100 lbs.....	0 60
Fourth class, per 100 lbs.....	0 50

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as 170 numbers can be reprinted—by application to the Editor.

## ENGINEERS and MACHINISTS.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

Previously.....	169,086 02

Total.....175,590 00

The Lowell and Andover railroad company has been organized. William Livingston, Esq., is president. It is expected the road will be completed by July next.

### Stony Brook Railroad.

This road is designed to open a communication between Lowell and Worcester, (Mass.) and the Connecticut River Valley direct, by connecting at Groton with the Worcester and Nashua road, and the Fitchburgh Railroad.

### Essex Railroad.

This road is designed to connect the Eastern Railroad at Salem with Lawrence.

### To Car and Locomotive Builders.

The attention of Car and Locomotive Builders is called to the following advertisements. "This company has, we understand, changed their policy in this department: having decided to purchase Cars and Locomotives from those engaged in the manufacture, rather than to keep up an establishment of their own for those purposes. We presume, however, that they will continue to do their own repairs mainly on their own premises.

**TO RAILROAD CAR BUILDERS.**—SEALED PROPOSALS will be received by the undersigned up to SATURDAY, the 6th of November, inclusive, for the construction of 20 HOUSE CARS, for freight, 2 BAGGAGE CARS and 2 MAIL CARS, according to plans and specifications which will be furnished, and for which proposers are referred to the Master of Machinery, at the Company's Mount Clare Depot, Baltimore, who will be prepared to exhibit them on and after the 25th current.

The House Cars to be delivered by the 1st of February, 1848; the Baggage Cars by the 1st of December, and the Mail Cars by the 15th of December next. BENJ. H. LATROBE, Chief Eng. & Gen. Supt. Baltimore and Ohio Railroad. 2143 Office No. 23 Hanover St., Baltimore.

**TO LOCOMOTIVE ENGINE BUILDERS.** Proposals under seal will be received by the undersigned up to SATURDAY, the 6th of November, inclusive, for furnishing the Baltimore & Ohio Railroad Co. with 4 LOCOMOTIVE ENGINES, in conformity with the following specification:—

1. The weight not to exceed 30 tons, of 3940 lbs., and to come as near to that limit as possible.
2. The weight to be uniformly distributed upon all the wheels, when the engine is drawing her heaviest load.
3. The number of wheels to be eight.
4. The diameter of the wheels to be 43 inches.
5. The four intermediate wheels to be without flanges.
6. The boiler to contain not less than 1000 square feet of fire surface, of which there shall be not less than one-fiftieth in the fire box.
7. The tubes of No. 11 fine iron, with not less than  $\frac{1}{4}$  of an inch space between them in the tube sheets.

8. The fire box with the exception of the tube and crown sheets to be of  $\frac{1}{4}$  inch copper.

9. The tube sheets to be  $\frac{1}{4}$  inch thick.

10. The boiler to be of No. 9 iron, of the best quality.

11. The fire box to be not less than 24 inches deep below the cylindrical part of the boiler.

12. The steam to be taken to the cylinder from a separate dome on the fore part of the boiler.

13. The frame, including the pedestals, to be entirely of wrought iron, and the boiler to be connected therewith, so as to allow of contraction and expansion without strain on either.

14. The cylinders to be 22 inches stroke, and not less than 17 inches diameter.

15. The cut off to be effected by a double valve, worked by separate eccentrics.

16. The angle of the cylinder to be not greater than 13 $\frac{1}{2}$  degrees with the horizontal line.

17. The frame and bearings to be inside the wheels and the direction from the cylinder direct with the back pair of intermediate wheels.

18. The centres of the extreme wheels to be not more than 11 $\frac{1}{2}$  feet apart.

19. The wheels to be of cast iron with chilled tire.

20. The means to be provided of varying the power of the exhaust in the blast pipe.

21. The engine to be warranted to do full work with Cumberland or other bituminous coal, in a raw state, as the fuel—and the furnace to be provided with an upper and lower fire door with that view.

22. The smoke stack to be provided with a wire gauze covering.

23. Two safety valves to be placed upon the boiler, each containing not less than 5 square inches of surface and one to be out of the reach of the engine-man.

24. The tender to be upon 8 wheels and constructed upon such plan as shall be furnished by the company, and to carry not less than 3 cords of wood or its equivalent in coal, and 1500 gallons of water.

25. The materials and workmanship to be of the best quality, and the engine to be subjected to a trial of 30 days steady work with freight upon the road, before acceptance by the company.

Payment to be made in cash on the acceptance of the engine. The four engines to be delivered at the company's Mount Clare depot, in Baltimore—the first on the 1st of February, 1848, and the three others on the 1st of March, April and May, ensuing.

The track is 4 feet 8 $\frac{1}{2}$  inches gauge, and the shortest curve of the road is 400 feet radius.

The company to be secured against all patent claims.

Further information will be communicated upon application to the undersigned, at the company's office, No. 23 Hanover street, Baltimore, to which the proposals suitably endorsed will be addressed.

By order of the President and Directors,  
BENJ. H. LATROBE.

Chief Engineer and General Superintendent.  
Baltimore, Sept. 18th, 1847.

### Iron Tubes for Locomotive Boilers, And the Mode of Securing them to the Tube Sheets.

We observe that Professor Johnson, in his able article on the "Use of Anthracite Coal in Locomotives," which we re-published in No. 39, from the August number of the Journal of the Franklin Institute, refers (page 615) to the difficulty of making iron tubes tight in the tube sheet. There has been, we believe, considerable difficulty in this matter—but Mr. Thomas Prosser, of 98 Platt street New York, who manufactures the lap-welded tubes, has an implement which he calls "Segment Tube Cutter," and which is used with great facility, forming, at the same time, a substantial shoulder both on the inside and outside of the tube sheet, or head of the boiler. The operation of this implement is very different from the ordinary mode of rivetting the tubes. It is composed of a ring—eleven segments of a circle of a peculiar shape within the ring, and in the centre of these segments a round tapering mandril, or pin, is driven, acting as a wedge as it is driven in, setting out the segments, and forming an internal and external shoulder, which ensures a tight joint. This is a very simple, yet very ingenious machine, or implement, and ought to be in the hands of every boiler maker who uses iron tubes.

### Pottsville and its Machine Shops.

It would be somewhat difficult for a person resident in, and who left the little village of Pottsville, Schuylkill county, Pa., twenty-five years ago, to recognize the place on his return to it at this time.—In 1824, there were but five houses—now there is probably fifteen hundred—with eight or nine thousand inhabitants, most of whom are directly, or indirectly, connected with the coal business. Among the establishments which attract the attention of strangers, are the machine shops of Messrs. Haywood & Snyder and E. W. McGinniss—which supply the steam engines, and large amount of machinery, for the numerous collieries, and manufacturing establishments of the coal region. These establishments have both grown up from simple blacksmith shops, to the employment of from one to two hundred hands each.

The establishment of Mr. McGinniss is, we believe, employed mainly in the manufacture of engines and machinery for coal operations—but that of Haywood & Snyder who had also an establishment at Danville, on the Susquehanna, has acquired a high reputation for making the machinery for rolling mills. They have not only furnished the machinery and rolls for several of the mills in this State, where railroad iron is made, but also for the large establishment of Mr. Cooper, at Trenton, N. J.; and even for one or two mills in Massachusetts—thus showing conclusively that merit—however modest and retiring—will be discovered and appreciated.

The visitor to this establishment at Pottsville can readily trace, and almost note the years of the growth of this concern; by the various additions and extensions of the buildings. The veritable old smith's shop, we believe, is still standing, in which Benjamin Haywood, the very enterprising and intelligent seignior partner, made horse shoes and horse nails, when he first came to the place. This is a remarkable instance of the success, and prosperity, of honest industry, guided by good judgment, and extraordinary energy of character.

We are not aware how long Mr. Haywood worked by himself—but we find him now connected with two partners, men of character and business habits—Mr. G. W. Snyder, in the department of machinery, and Mr. Benjamin Milnes, in the coal mining

and its various operations. We are told that the aggregate amount of their business, in the two departments—machinery by Haywood & Snyder, and coal by Haywood & Milnes—amounted in 1846 to over seven hundred thousand dollars.

Let the young men of this country, and of other countries too—for Mr. Haywood is a native of England—and especially young mechanics, learn a lesson from this, and recollect that industry, perseverance and integrity may be as successful at the anvil, or in other mechanical pursuits, as in mercantile operations of the learned professions—and twice as useful.

### Kirk's Steam Tilt Hammer.

We saw at the Machine Shop of the Reading Railroad Company, in Reading, a few weeks since, three of these very useful implements in operation. They are constructed in the form of the ordinary, tilt, or trip, hammer—but the power is applied in a very different manner. Instead of the ordinary machinery for such purposes—a large fly wheel, etc.—you see a small cylinder, but little larger, or higher than your hat, placed under the lever, or beam, to which the hammer is attached—in front of the frame in which, or the pivot upon which, the lever operates. In this cylinder moves a piston with a perpendicular motion, giving action to the hammer.

The first, or smaller one, put in operation by Mr. Kirk, was for ordinary purposes, in the blacksmith shop, and so rapid is its movement, and delicate its touch, that it might be used for making horse nails.

The next put in operation, was in the same shop, and is used for working up the immense quantity of scrap iron which has accumulated about the shops of the company, by which means they are now supplied with a large amount of the very best iron for the ordinary work of the shops. After using these hammers for a time, and finding their great utility, the company have erected one of much larger dimensions, with which they are working over, and bringing again into use, their thousands of old axles, and working up, we suppose, their condemned rails.

We should like, right well, to give a more intelligible description of this exceedingly useful machine, as we deem it worthy of being generally known—as to understand it fully, will be to introduce it extensively into use.

When at Boston recently, we saw a model of it at the fair—where it attracted considerable attention. We hope to get a full description of it, with drawings, from Mr. Kirk soon, when we will refer to it again.

### Hinckley & Drury's Locomotive Engines.

It is but a short period, two or three years, since we first met with an engine built by these gentlemen; and never visited their manufactory until March, 1846—when in Boston for a day or two, we had the pleasure of spending an hour in their shop, where we found specimens of excellent work. They were then materially enlarging their workshop, in order to be able to fill the orders which were increasing upon them.

When recently on a visit to Boston, and its vicinity, we saw numerous practical—we might almost say *breathing*, if not living—witness of their industry and skill, for we found their engines in general use. We saw them at work on every New England road that we visited—and on some of the roads we saw no others. It was our intention to have visited their shops again, but a rainy day prevented. We however met one of the gentlemen at the Fair—learned that their orders have fully kept pace with their increased ability to meet them, and that for a

considerable time they have turned out an engine a week—or at the rate of over fifty a year.

We have, in our office, lithographic prints of their six wheel engine with one pair of drivers, and their eight wheel engine with two pair of drivers; but are not aware that any of their engines have found their way south of the Long Island road yet, but understand that they are finding their way westward into Michigan; and they are sure to find their way into Ohio, Indiana and New York, for two reasons—first, because they are equal to any others made in the country, and, secondly, because the Boston people, who are interested in the western roads, know their worth, and seldom neglect their own mechanics, when they have an opportunity to serve them.

### Lowell and Andover Railroad Company.

At the annual meeting of this corporation, held yesterday, says the Lowell Courier of 12th instant, the following Directors were chosen for the ensuing year, viz: William Livingston, Sidney Spalding, Otis Allen, Frederick Parker, Horace Howard, Isaac Farrington and Abner W. Buttrick. Afterwards, at a meeting of the Directors, William Livingston was elected President, Frederick Parker, Clerk, and John A. Knowles, Treasurer. This road, which is twelve miles in length, will be connected with the Boston and Lowell, the Nashua and Lowell, and the Stony Brook Railroad, at Lowell, and with the Boston and Maine and the Essex Railroad, and a branch railroad leading to Lawrence, near the bridge on the road leading from South Andover to Lawrence. The Lowell and Andover Railroad will, it is expected, be completed by the first of July next, when there will be a continuous line of railroad from Portland through this city to Albany, with other railroads extending from it at frequent intervals, and running in various directions.

### Ray's Improved Car Wheel and Truck.

The plans of wheels for railway cars are almost "too numerous to mention;" many of which have been improvements upon those in use before, and some not.

When recently in New York we saw a new plan of wheel, invented by Mr. F. M. Ray, and which may be termed the "cushioned wheel"—as it is cast in two parts, and has a layer of caoutchouc—or prepared india rubber— $\frac{1}{4}$  inch thick, between the parts. The centre part of the wheel, comprising about  $\frac{1}{4}$ ths of its diameter, is cast in one part and without those openings in the hub, usually left to accommodate the shrinkage of the iron. The hub, or bearing upon the axle, is rather longer than usual, and the body of the wheel, of the part between the hub and the outer rim of this part is strengthened by ribs on the inside, extending like spokes from the hub to the rim. The tread of this part is about 24 inches broad, and flat. The remaining part of the wheel, equal to about one-fourth of its diameter, is cast separate upon a *chill*, like other cast-iron wheels—thus forming about as much of the wheel as would be occupied by wood fellows with a wrought tire and flange. The external diameter of the inner part is smaller than the internal diameter of the outer part, or rim of the wheel, by which there is a space, the entire circle, of  $\frac{1}{4}$ th of an inch between the two parts, which is filled by vulcanized india rubber, or caoutchouc, prepared in a certain way; which gives it a most extraordinary tenacity and firmness—yet retaining its elasticity. The two parts are put together and held in place by flanges and bolts—not easily described without drawings—apparently as solid as the wheels in general use,

while this cushion of india rubber serves to prevent the ordinary concussion of the wheels upon the rails; and thus prevents, it is believed by those who have examined them,—at least to a very considerable extent—the wear and tear of machinery and rails. Its effect is said to be much like putting the rubber on the rail and passing the wheel over it,—yet it does not, of course, like that operation, prevent, or at all interfere with, the adhesion of the wheel upon the rail. We are informed that a car, with these wheels, is in use upon the New Jersey Railroad, between Jersey City and New Brunswick, and that it is very much approved of. One of Mr. Ray's Trucks, with these wheels, was exhibited at the Fair in Boston; and we understand that a company has been formed there for the purpose of furnishing wheels of this pattern, and manufacturing cars upon a large scale.

#### Railway Cars and their Improvements.

When at Boston, a short time since, we saw one of the most beautiful and highly finished cars that has fallen under our observation. There were seats for sixty persons—finished in the most tasty manner, with spring seats covered with crimson velvet, of a very rich pattern. It was constructed by Davenport & Bridges, of Cambridgeport, near Boston, upon their most approved truck, hung in such a manner as to have a lateral motion, by which the side thrust, and shock from inequalities of the road, are in a great measure avoided. Cars of this kind are in use, we are told, on the Eastern railroad, where they are very much admired. Indeed the cars of Davenport & Bridges are in high repute wherever used.

#### Great Western, (Canada), and the Buffalo and Mississippi Railroads.

We give place to the following communication, at the request of the writer; that both sides of the question may be heard—and in the hope of directing attention to the important line which must be constructed on the south side of the lake, and from lake Erie to Chicago. That region of country is exceedingly fertile, and becoming too populous to remain long without participating in the advantages of easy, cheap and rapid communication with the seaboard, especially as there is to be a rival line on the north side of the lake, and another through the central portions of Ohio, Indiana and Illinois, to the Mississippi. It does not require the gift of prophecy to foresee these events—indeed, an ordinary share of sagacity, reasoning from past to future, will see that there must be a line of railroad on the south side of lake Erie to Chicago and Galena. This communication calls attention to the south side, or central line, and refers to a report of reconnaissance and surveys, to sustain the position that it is the true line. We shall publish a part of the report referred to, that its comparative merits may be understood.

The communication is as follows, viz:

For the American Railroad Journal.

In the able and interesting report of CHARLES B. STUART, chief engineer of the Great Western (Canada) railway, published in the Journal of the 18th and 25th September, there appears to be several errors of fact and reasoning, the correction of which may benefit some of your readers; and therefore I beg leave, with great respect for the author of that report, to notice some of its more important inaccuracies.

Speaking of a great line of railway westward from the lower end of lake Erie, the report says:— "This westward line cannot be deflected to the south, for lake Erie lies in the way." This is a mistake. A route from Buffalo to pass the south bend of lake Michigan is shorter by the south shore than by the

north shore of lake Erie. The report says of the route through Canada: "I know of no case in this country, or elsewhere, comparable with this, and it is doubtful whether another location, of the same extent, can be found on the continent, so well adapted to the attainment of high velocity and great economy of transportation." There are routes in the west, and very many of them, of equal length, still more favorable for horizontal and straight railroads. That around the south shore of lake Erie need not have half the elevation (360 feet) of the Canada route to overcome, and it would be straight enough for all practical purposes.

"The belt of country extending from the Hudson to the Mississippi, through the centre of New York, Canada West, and Michigan, is the most even and uniform that is to be found in any parallel, between the western waters and the Atlantic coast."

This may be true as applied to the country eastward of Buffalo, but it is quite erroneous respecting the country west. From the western extremity of lake Erie, at Toledo, a route hundreds of miles in length, of easier grades than that of the Central railroad of Michigan, may be found in any direction from west to south. As proof of this assertion, I would refer the enquiring reader to the surveys of a railroad from Toledo to Chicago, and of the Wabash and Erie and the Miami and Erie canals. A straight line from Toledo to St. Louis, 370 miles long, would offer fewer obstacles to the construction of a railroad than any line across the peninsula of Michigan, which has been surveyed.

The report says, that passengers for Detroit will save 196 miles, by taking the north side instead of the south side of lake Erie, even after the completion of the New York and Erie railroad and the eastern line of projected railroad on the south side of the lake. This is an exaggeration of the difference, but that is not important; for any one may see by a glance at the map, that all passengers between the east and the west are not obliged to pass through Detroit. If passengers are bound as far south as the south shore of lake Michigan, they will find the American route, south of lake Erie, the shortest. Mr. Stuart, therefore, claims too much for the Central railroad, when he allows it any portion of the trade or travel of Indiana, Illinois, Wisconsin or Iowa—unless it be obtained across lake Michigan, or in competition with the railroad to Toledo, fifty miles shorter. The navigation of lake Erie, the report represents to be more dangerous than the ocean. Here is room for a difference of opinion. I think the navigation of lake Erie much less dangerous than any portion of our Atlantic coast of the same extent.

The report represents the exports of breadstuffs from lake Erie, in 1846, at upwards of fifteen millions of bushels; of which it says a large proportion, besides that which was shipped at Detroit, "was carried from ports west of Detroit, directly past the two termini of your (Great Western) road." This is a wide error. Detroit furnished 2,438,635 bushels, and the ports of lake Erie, from Monroe to Cleveland, inclusive, sent forward within a fraction of ten millions bushels. The whole quantity of breadstuffs which passed Port Sarnia and Detroit, was considerably within three millions of bushels—being less than was shipped from the single port of Toledo. (See Hunt's Merchants' Magazine, vol. xvi, p. 363, 364, 365.) Of the two and a half millions bushels of breadstuffs which passed out of lake Michigan, not much over a quarter of a million would have passed Sarnia and Sandwich, if a railroad had been in operation from Chicago to the west end of lake Erie at Toledo; supposing the estimate

of the power of railroads to compete with lake navigation, made in this report, to be correct. Upwards of two millions went forward from Chicago, Michigan city and St. Joseph, all of which would be arrested and borne across the peninsula to Toledo, if it could be stopped at Sarnia and Sandwich and carried across to Hamilton by the Great Western railroad. In the former case the saving in distance by railroad is more than two-thirds; in the latter, less than that proportion. A glance at any correct map will show the advantage of proportionate saving of distance to be in favor of the Michigan peninsula, between Michigan city and Toledo, over the route across Canada, from Sandwich and Sarnia to Hamilton. The route for the railroad across the Michigan peninsula is not inferior to that across the peninsula of Canada; for proof of which, I refer to Mr. Baldwin's report, of which a copy was, some months ago, forwarded to the editor of this Journal.

In making the map to exhibit to advantage the Great Western railroad, there are some omissions, to which I beg to call the attention of your readers. The western end of lake Erie has much resemblance to the western extremity of lake Ontario. Both penetrate deeply into the country, and thereby hold commercial sway over the territory for which they offer the nearest ports. Hamilton and Toledo hold these favored positions.

The map purports to give all the public improvements which have any bearing on the work recommended in the report. Yet it neither gives Toledo any place, nor does it vouchsafe a place for the Maumee river, which drains a country half as large as the lower peninsula of Canada West. But, less excusable than these omissions, it leaves out two long lines of navigable canals, centering at the west end of lake Erie, in Toledo, and having a course, now in navigable condition, of 460 miles. Still less excusable is the omission of one hundred miles of railroad now in operation, running nearly parallel with the favorite Central road, and terminating by two branches in Monroe and Toledo. This road extends 70 miles from Monroe to Hillsdale, having a connection at Adrian with a branch 33 miles long to Toledo.

The railroad recommended by the report of Mr. Stuart has great merit. It should be made, for it will pay well. Having merits of its own, it should stand on them, neither claiming what is due to other routes, nor detracting from their just claims.

In the remarks above, I have corrected some of the errors which the report seemed to me to contain. All are liable to mistakes, and none are more willing to be corrected than those who labor for the public good, as engineers of our principal works.

Yours truly, J. W. SCOTT.

#### Iron Trade.

The iron trade has improved since our last advices. Rails are quoted, October 1st, at 29 average, and chairs 25 15s. a 26; Swedish £11 5s.

The monthly report says: Welsh bars are still in good demand, and the price is consequently firm; the same may be said of Staffordshire. Scotch pig declined a little during the latter part of September, owing to several parcels having been thrown on the market by parties desirous of realising, but most of the purchases were for home use. The majority of the men who had struck have returned to their work, at the reduced wages proposed by the masters. A few sales of Swedish have been reported for the American market. In steel nothing doing.

Corren remains steady, with a fair demand. About 240 tons of refined Chilian, in ignots, and a small parcel of slabs, have been recently imported

here: the former is held at 93 $\frac{1}{2}$ , and the latter at 84 $\frac{1}{2}$  per ton.

*Glasgow Pig-Iron Trade, September 30.*—The business done this week in Pig-Iron has been moderate in amount. Commercial embarrassments, and the continued tightness in the money market, have caused a farther decline in prices. Several sales of mixed Nos. have been made at 61s. cash, at which we quote the price to-day.

#### Oregon or Pacific Railroad.

This gigantic project is attracting the attention of able men. Mr. Whitney has succeeded, by his energy and great familiarity with the subject in all its bearings, in arousing an interest in its favor in almost every part of the country. He has travelled many thousand miles, and conferred with many eminent men, and made many addresses to legislative bodies and popular meetings, that his views and wishes, and intentions may be fully known in relation to it; and he has succeeded, by his able argument, his clear and forcible illustrations, and the great desire of the people for such a work, in enlisting thousands in its favor; and the project is now evidently gaining ground with the people.

We have had on our table, for several weeks, an able letter in its favor from the Hon. *Zadock Pratt*, of Green county, New York—which ought to have been published before—taking strong ground in favor of the project. Mr. Pratt has evidently investigated the subject, and he gives many important facts, not generally understood, which may be useful as a matter of reference. We are indebted to the National Intelligencer for a copy of the letter.

#### To the People of the United States.

The subject of a passage across our Continent to the Pacific is exciting the attention of the public mind to such an extent as makes it necessary for every statesman and citizen interested in the welfare, prosperity, and future greatness of our country, to examine the subject, for his own satisfaction at least.

Two routes and modes are proposed to accomplish this great object. One by a canal or railroad, somewhere from Panama to Tehuantepec, in Mexico, between latitude north 7° and 16°; and the other a railroad, from Lake Michigan, through the Rocky Mountains, to Oregon, on the parallel of about 42 $\frac{1}{2}$ °, all on our own territory. I wish first to consider the canal, and see what it would and would not do, and see how we can build it.

The Hon. Mr. Wheaton, late Minister at Berlin, in his very able letter to the Secretary of War, shows that he has studied the subject, and made himself acquainted with all the lights then before the world; and even he leaves all in doubt and conjecture. If it can be done at all, it must be by the combined efforts and influence of all the different commercial nations interested. The English reviewers take the same view, giving to each nation its proportionate interest and influence, comparative with its amount of commerce with Asia, which of course would give the entire control to England. Would the people of the United States submit to such control? And does the constitution provide for the forming and carrying on such a copartnership? Clearly not.

In Gen. Garella's very able, and the only scientific report of a survey of Panama, in

the years 1812 and 1813, with a corps of engineers, under the orders of the French Government, he takes up and examines the routes of Nicaragua and Tehuantepec. His estimate for the former is about one hundred and forty eight millions of francs, for the latter one hundred and fifty one million four hundred and fifty thousand, and for Panama one hundred and forty-nine to one hundred and sixty-five million. These estimates may be considered as conjectural, as he says he had no comparison as a basis. It would be subject to every possible embarrassment; the sparse population of a lawless character, no security of person or property, and the Mexican Government unable to enforce laws if she had them. A strong military force would be absolutely necessary, from one end to the other, both to support and protect the works and the commerce. An entire absence of material; laborers and material to be taken from a northern clime; subject to heavy expenses in execution, both from climate and local position, the former so uncongenial to our citizens as to render it almost if not quite impossible to sustain them. Therefore, the work could not be done, protected, or commerce carried on. It is fair to presume the results would far exceed Gen. Garella's estimates. In fact, another estimate by him for Tehuantepec is as high as 181,450,000 $\frac{1}{2}$ , and from all our experience in such estimates, and the fact that the people of the North cannot live in such a climate, the winter months so rainy and summer so hot that no men could work or stand it, we have good reason to believe that the actual cost would very far exceed any estimate made. General Garella abandons all as inferior, and devotes all his effort to Panama.

Now the question is, can we do this work; and how; and what would be the probable results? It is, I think, perfectly clear that our Government cannot furnish means, nor enter into such a copartnership. Then, if done, it must be done by individuals. Would Boston, New York, Philadelphia, Baltimore, Richmond, Charleston, and even New Orleans, furnish capital to build a thoroughfare, and population for a city to carry on a commerce under another Government, in the benefits of which they cannot participate, nor derive any income for their capital? This is what no business man would do. And now let us see if this would be so. We will suppose the canal to be built, and all the commerce of Europe with Asia passing through it. Europe would furnish her own vessels for both sides—a ship canal, no transshipments required—and, I ask, what benefit could any city, on all the Atlantic or Gulf coast, derive from it? Surely none. In a political point of view, it would place all the marine, naval and commercial, of all Europe permanently and directly at our doors, in the most commanding position; and, as to our own commerce with Asia, would it be benefited at all by this change of route? Our commerce with Asia is not now large, owing to the fact that climate, distance, and expense prevent an exchange of commodities; which difficulties could not be removed by a canal.

The climate would forbid the passage of our produce through it. Nearly all our commerce with Asia is with China, consisting of teas, silks, &c.; and, mostly consumed north of Charleston, could receive no benefit from this route, but, on the contrary, would be subject to delays, losses, dangers, and damages from climate, and any benefit to the small amount which might perhaps be taken directly up the Mississippi as far as the mouth of the Ohio would be more than overbalanced by the delays and damage of climate, which none but those acquainted with the business can understand. And would the states and cities north of the Gulf furnish means to the amount of from thirty to fifty millions, and submit to such a tax, barely to put out of their possession and under another Government the route for a commerce which they cannot participate in or ever control? Clearly not. Such, it appears to me, would be the result of the canal, even with all the success predicted. It would be productive to us of nothing but evil. We have declared to the world that we will not submit to any foreign intervention or control of the affairs of this continent; and, at the same time, propose to enter into an alliance, offensive and defensive, whereby we yield the control of the commerce of the world, check and retard our prosperity and destiny for half a century at least, and finally end in a desperate, bloody, and expensive war!

The object of a canal or railroad is to shorten the route from Europe to Asia, and, if possible, bring that commerce, which has controlled the world from time immemorial, across the continent; and, by lessening the expense, shortening the time and distance, and facilitating and increasing intercourse, to increase that commerce by a further and more diversified exchange of commodities. Barely substituting one route for another could not increase, because that alone could not create or produce any new means to sustain it. If a new route opens to production a wilderness, and thereby increases population, with means to sustain it and afford an exchange of commodities, it would, of course, increase commerce; or a new route which would greatly lessen expenses of transit, save much time, increase and facilitate intercourse, would naturally increase an exchange of commodities, and would also increase commerce. But neither of these desirable and all important results can be gained by a canal, because a canal or railroad across any part of the isthmus could not open to settlement and production an extend of wilderness country, as it is not there—Nature here having fixed the bounds over which the genius of man cannot dominate; climate, sterility and all, obstruct his course. And it could not shorten distance and time, lessen expense, facilitate and increase intercourse; as I will show there would be no shortening of distance or time, by giving the exact distances to be performed, both around the cape and through a proposed canal, as has been given to the public by Mr. Whitney, and from the authority of Professor Wittish, of the London University:

These distances appear so much shorter than those for the route across the isthmus, that an explanation is required. First, we start from London, latitude  $50^{\circ}$ , and cross the isthmus in from  $7^{\circ}$  to  $16^{\circ}$  north latitude, and about  $90^{\circ}$  west longitude, thence to Canton, latitude about  $23^{\circ}$ , and east longitude  $113\frac{1}{2}^{\circ}$  or about  $170^{\circ}$  of longitude, each degree of longitude full 60 miles, making from the terminus of the canal to Canton over 10,200 miles. Whereas, from Columbia river, latitude  $46\frac{1}{2}^{\circ}$ , to Shang-hai, latitude about  $32^{\circ}$ , and east longitude  $122^{\circ}$ , where all the commerce of China would centre, is  $110\frac{1}{2}^{\circ}$  of longitude, measuring on this parallel about 47 miles each, a distance of 5,400 miles.—thus it will be seen that for a vessel bound from the terminus of a canal across the isthmus to China, the shortest and best route would be first to the Columbia river, and then to China. Thus we see that this would gain over that of the isthmus from London to China 3,758 miles, to Australia 2,440 miles, to Singapore 1,398 miles; and New York gains over Europe about 3,000 miles to all these places. This seems to be Nature's route. On this belt, this line around the globe, is almost all the population of the world; on this line is and will be the greatest production of breadstuffs and meat, the sustenance of man and of commerce, adding wealth to the nation; the only route which can of itself furnish the means to build the road, or where the labor of men can make it available. Nature has here smoothed the way, and opened the mountains to let us pass. Then look at our picture, our position, with

this road completed; behold with one hand we reach out over the Pacific to the millions of Japan, China, and all Asia, with our manufactures, our cotton, our tobacco, our hemp, our rice, our flour, our corn, beef, pork, leather, and all our many and various products, and receiving back in exchange their teas, coffee, sugar, spices, indigo, drugs, silks, and various useful and curious fabrics, with gold, silver and precious stones—all, too, with our own ships and our own men; and with the other hand over the broad Atlantic, to all Europe, our various products in exchange for theirs, and receive their surplus population, to whom we give a home, a country, while our body draws to it and controls the rich commerce and wealth of all the world, spreading and circulating from ocean to ocean, thro' every artery, through every city from Texas to Maine, and from the heart, the centre, would spring and flow forth throughout the whole frame, the whole system, the life, the products of man's labor, from the earth, which created, would control and sustain it. The picture is grand, and might be considered a vision, had it any other foundation than the wilderness earth, which by the labor of man is to bring forth all we want, and at the same time richly reward that labor. It is a great plan, a great work; but we are the people to do big things. This we have only to commence; it works itself. Build the first mile and it prepares the way for another. The settler has the means of free transit to market, and his labor is wanted on the road; he is at once made independent and happy. It is the poor man's road, his hope and promise. It is the farmer and mechanic who will receive the greatest benefit; their small means and their labor on the road could purchase the land for 40 to 160 acres; their labor and crops immediately wanted on the road, and if a surplus, a free transit to market. Villages and cities would spring up, from one end to the other, all independent and happy, because the free intercourse with all the world afford a full reward for labor. Then will you take your money and send it out of our country, to be used against your interest, or will you have the Oregon road, which will cost you nothing but your votes? Mr. W. does not ask for one dollar in money, nor will he subject any man to one cent of taxation, and no harm to any; he does not even ask a survey for his route; all he desires is that the waste wilderness land may be placed so that by sale and settlement the means in money and labor can be produced to build the road, and when the road is completed, to be under the control of Congress, of the people, and no dividends. All this he proposes at his own risk and hazard, and if it fails the people lose nothing, as no part of the lands would be granted to him faster than the road is built. It appears to me that this is no mysterious affair—a plain, simple, business plan, grand and sublime, but as simple as grand.

I examined this subject nearly three years ago. I then endorsed it, and presented Mr. Whitney's memorial to the 28th Congress. Since that time it has grown upon the public mind, and I believe the people will have it, and the sooner the better. Z. PRATT.

#### FURTHER SHIPMENT OF COPPER—GOLD AND SILVER ON LAKE SUPERIOR.

A Detroit correspondent of the Tribune, under date Sept. 9, 1847, says:—"There are now at the Sault, 100 tons of native copper and copper chippings belonging to the Pittsburgh and Boston Company, brought down by the Napoleon on her last trip. The Propeller, it is expected, will bring fifty to seventy-five tons more. Col. McKnight is now loading a propeller here with supplies for this company, and will bring down, by the last of next week, another cargo, which, added to that already shipped, will make 334 tons shipped this season. The poorest portion of the cargo of the Jena yielded 65 per cent. of copper. The produce of this mine alone, this year, must equal, at least, three hundred tons of pig copper.

"We learn that Mr. Seymour, the distinguished German metallurgist, now in the mineral country, with Gen. James Wilson, of New Hampshire, has demonstrated that this native copper, particularly that at Copper Falls, contains alloy of both silver and gold, which gives it that peculiar bright appearance which distinguishes it from English copper. Another year's work will convince all, that we can do better than import copper from England."

#### LAWRENCE SCIENTIFIC SCHOOL.

ABBOTT LAWRENCE, Esq., of Boston, sometime since gave fifty thousand dollars for the endowment of a school at Harvard University, for the purpose of teaching, more thoroughly than has been common in this country, Geology, Mineralogy and Engineering. At a meeting of the Corporation of the University, at the late commencement, it was resolved to call this department the "Lawrence Scientific school." The American Mining Journal, published in New York, gives the resolutions of the Corporation, and accompanies them with the following remarks.

At a meeting of the corporation of the Harvard University, on the day of the late commencement, the following vote was passed:—

"Whereas, Hon. Abbott Lawrence, of Boston, has presented the sum of fifty thousand dollars to the President and Fellows of Harvard College, as an endowment of the Scientific School in this University, and for the foundation of Professorships of Geology and Engineering in the same, it is, therefore, unanimously

"Voted, By the President and Fellows, in token of their gratitude for this munificent donation, and in perpetual commemoration of the same, that the Scientific School, be henceforth, known and designated as the 'LAWRENCE SCIENTIFIC SCHOOL, in the University of Cambridge.'"

Mr. Lawrence, whose munificent gifts to various objects of public and private charity had before attracted a large share of regard, has conferred lasting honor on his name by founding this school; which, if well managed, must prove to be of the greatest service to the interests of this country and the world.

On the other side of the Atlantic, the necessity of establishing similar schools for the acquisition of knowledge in the practical sci-

ences, has not escaped the attention of those entrusted with the administration of public affairs, in the continental States of Europe. In France, M. Dumont, late Minister of Public Works, first proposed the erection of schools of Mining and Engineering, in the Mineral Departments, and the Chambers voted the necessary means without opposition. The Royal School of Mines, at Paris, established under his auspices, is considered one of the best scientific establishments of the French capital. Schools of Mining and Engineering are about being established in the departments of the Loire, Rhone, etc.; one at Orleans and Lyons, which will embrace the whole of that district; one at Montpellier and Bordeaux; one at Douai, which will embrace the departments of the North, comprising the great mining district of Mons, Valenciennes, etc.; one in the department of Sambre and Meuse, and the Upper and Lower Rhine. Men of the highest talent and the most enlarged experience, with good salaries, will be entrusted with the education of the students in those branches; the buildings will be fitted up on a large scale, with commodious lecture rooms, model rooms, and libraries, containing the best works on Mining and Engineering in every language.

The French and other languages will be taught gratis; and after having undergone the different degrees of study, both practical and theoretical, in every portion of each branch of learning embraced in the course of instruction, diplomas will be granted to students either as miners or engineers. The education in the department of mining will comprise mineralogy, geology; and all the best systems as yet adopted in every country in mining operations, a chemical knowledge of the various ores and strata, the sinking of shafts, driving of adits, the clearing of the water, and the principles of pneumatic and steam-power, ventilation of mines—in fact, every part connected with exploring, blasting with powder and gun-cotton, and all modern improvements in the science; the making of various metals, etc.

The education in the department of civil engineering will comprise railway surveying, levelling, etc., land and estate engineering, government surveying, geological and marine surveying, the construction of locomotives, railways, and all the requisite materials appertaining to railway cutting, embanking, tunnelling, bridges, and viaducts, the different gauges, the construction of ships (wood and iron,) and steam-engines for marine purposes.

In Austria, Mining Colleges have existed for many years, and have furnished many celebrated men to the scientific world. The miners in that country are a "privileged class," being exempt from service in the army and navy, and free from taxation; but they cannot leave the country without first obtaining permission from the Minister of Public Works and the President of the Mining Department.

In Russia there is also an Imperial College of Mines, at St. Petersburg. In Prussia and Belgium there are Schools of Min-

ing in the districts of Liege, Brussels, and Berlin. In Spain, there is one at Madrid, and Rio Janeiro, the Brazils, Havana, Bogota, Chili and Peru, Mining Colleges have been established on an extensive scale;—still there has never been any in England, one of the most important metallic countries in the world, nor in the United States, whose mineral resources, in almost every kind of metal, are vast beyond calculation, until the intelligent and liberal mind of the Hon. Mr. Lawrence laid the foundation for the "LAWRENCE SCIENTIFIC SCHOOL IN THE UNIVERSITY OF CAMBRIDGE." We hail the establishment of this school as auspicious of the highest good to the great and growing mineral interest of this country, as well as to the cause of scientific and practical learning among our people.

The buildings necessary to carry out Mr. Lawrence's intentions, are already in process of erection under his immediate superintendence, and will be completed at an early day.

#### MINING OPERATIONS ON LAKE SUPERIOR.

We take the following reports, in relation to Lake Superior Mining operations, from the New York Mining Journal of September 15th.

The United States Mining Officer, on Lake Superior, is requiring reports of the progress made in mining operations, from those holding locations, or working the mines in that region. We are very glad to learn that this is the case, and hope through this source, to be able to give to the readers of the Mining Journal the authentic information, which all persons, at all interested, so much desire. It will probably turn out that, of more than one hundred associations, formed ostensibly for mining purposes, not more than thirty are engaged in mining, and but few of these to any considerable extent. We have, on repeated occasions, expressed the desire that the persons having charge of mining operations, for the various companies, should furnish us with full reports of the progress made at the several mines in their charge; but our desire has, thus far, been complied with in very few instances, and we are left to attribute the neglect either to indifference to letting the world, and particularly the stockholders, know what is going on, or to the reason, (quite as improbable, we trust,) that the least said upon the subject the better. The Lake Superior News gives us a little light occasionally, and we hope the Mineral Officer, as from time to time he receives reports, will furnish that paper with the data to enable it to give us more. To the News, of the 28th ult., we are indebted for the following account of operations at several locations:—

**ISLE ROYALE AND OHIO MINING COMPANY.**—From the reports of the Agents of the Company, Messrs. RANSOM and BLAKE, made to the Government Mineral Officer, for the months of June and July, we learn that the Company are holding locations numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 34, and 43, made on Isle Royale, by Professor LOORE, in July, 1843, under permits from the Secretary of War, and heretofore reported to the War Department and to Congress. On the loca-

tions, the Company have at present some fifty persons variously employed in clearing the ground at and about the village of Ransom, Rock Harbor, in building houses, and in exploring and opening veins.

At Ransom, several houses have been erected, and preparations made for putting up a smelting establishment, for which the Company have much of the necessary machinery on the ground. Houses have also been erected on each of the locations; and on location No 11, there are houses at several veins. Several acres have been cleared, and planted with vegetables that look remarkably promising, and that have already furnished articles for table use.

A number of veins yielding copper have been opened, and experimental shafts sunk a short distance; but no mineral has been smelted, exported, or prepared for exportation. Several new veins of promise have recently been discovered, and the agents are sanguine in expectations of valuable copper ore.

**THE SCOVILL MINE—ISLE ROYALE.**—The mine of Philo Scovill is on location No. 40, on northeast end of the Island. In conformity with the Government requisitions, Mr. Scovill reports that he has three men engaged, besides himself, who were employed during June and July last in enlarging their buildings and exploring. A house and smith's shop have been erected, and in the latter a small smelting furnace has been put up. Explorations, with a view to mining, have been made, and a shaft sunk about ten feet. No mineral has been raised.

**LOCATION No. 14—ISLE ROYALE.**—The mine of C. G. Shaw, H. A. Ackley, P. Card, and others, is on location No. 14, located in July, 1843, by James Smithwick, and situated on Rock Harbor, bounded south by Lake Superior, west by location 13, (occupied by C. Whittlesey and others,) north by location 37, (occupied by Mr. Duncan,) and east by location 40, (occupied by P. Scovill. Mr. Shaw reports a force of seven men, who were engaged during June and July in erecting and enlarging buildings. Three dwellings, a smith-shop, and a root of provision house, have been completed. Two shafts have been sunk—one twelve feet deep, and the other fourteen feet—besides running a drift of about forty feet. No mineral has been exported or prepared for exportation. They still continue exploring.

**QUEBEC MINING COMPANY.**—The schooner Chippewa, Captain Angus, came down from Point aux Mines and Mica Bay of the north shore, on Friday last, with Mr. Wilson, government officer, and C. W. Ross, Esq., Clerk of the Quebec Company. From the latter gentleman, and Capt. O. H. Mathews, the resident superintendent of the Quebec works, we learn that every thing connected with their enterprise is progressing most satisfactorily. We have been shown some specimens of rich bi-sulphuret of copper discovered in veins that may be characterized as feeders to the great vein of grey sulphuret which the company are now engaged in developing, and which was more fully spoken of in our paper a few weeks ago. An addi-

tional force of some twenty or twenty-five men for these works came up on the last trip of the Detroit, and will be immediately set to work. Indeed, under the energetic and experienced superintendence of our excellent friend, Captain Mathews, the Quebec Mining Company, with present prospects before them, cannot fail of receiving ample reward for their enterprise.

#### COPPER ORE MINING.

We mentioned yesterday, (says the Detroit Advertiser of the 21st,) the arrival at this port of the propeller "Goliath," freighted with Copper Ore, from the famous Cliff Mines. While at our wharves, she was visited by a large number of our citizens, attracted by the peculiar character of the mineral. The larger part of the ore is in large masses or boulders of native copper, weighing from 200 to nearly 4,000 lbs.; twenty of them actually weighing over 2,000 lbs. each. One piece, of a square shape, eighteen inches thick, and apparently pure copper, was marked 3,707 lbs. It was cut from a single mass, weighing, in the mine, 40 tons, or 80,000 lbs. We noticed boulders marked 2,798, 2,660, 3,707 lbs., &c.

A considerable portion of the load was copper chips in barrels. The whole freight on board was 180 tons, and this is but a small share of similar ore ready for shipment.

We learn from a credible source that the company paid in cash to the government agents a per centage on \$45,000 for the shipments by the Goliath, rather than pay in kind after smelting.

The shipment is insured for \$28,000, and is valued at \$63,000. We are told that \$12 per ton will pay the forwarders handsomely for transportation from the Sault to Boston.

The shipment, with that by the propeller Cathcart from the Bruce Mine, will test, in some measure, the probable productiveness and value of these mines.

#### Locomotives, Long and Short Boilers.

The following remarks by the Editor of the Railway Chronicle, in relation to the construction of Locomotives, may be useful to some of our readers and we therefore give them a place.

**Long Boiler Locomotives.**—(Stephen's.)—Mechanics is generally reckoned one of the exact sciences, and its doctrines are accordingly placed among the truths about which there can be no dispute. In practice, however, it is by no means either exact or indisputable, for there is no class of men among whom there exist greater differences of opinion, more fertile sources of controversy, or more opposite systems of practice, than professional mechanics.

In the construction of locomotive engines, this want of perfect precision, this diversity of practice and opposition of opinion are strikingly exemplified. If there be a subject which from its nature we should fancy to be as clear and plain as a mathematical problem, and as capable of demonstration as the forty-seventh proposition of Euclid, it would be the determination of the respective powers, properties and functions of locomotive engines of which the forms are given. So far,

however, from this being the case, we have not only no fixed set of recognised principles, but we have actually as great diversity of fashion, tastes, prejudices, predilections for forms, arrangements, and contrivances, as if the coupling of an engine, the length of a boiler, or the size of a wheel, were as much a subject of taste and whim as the cut of a coat, or the length of the regulation feathers in Gen. Pasley's cocked hat. This is well illustrated in the present state of public opinion on what are called "long-boiler locomotives." Our readers remember when six-wheeled engines of an extra length first came into fashion—they may remember, that Mr. Bury's short-boiler engines came next into vogue; by-and-by they were found, or fancied, neither strong enough nor safe enough, and then came in again the long boiler with six wheels. Next we had an outcry from the broad gauge against the unsafeness of the length of the narrow-gauge engine, and now we have the broad gauge themselves building engines exceeding in length anything ever dreamed of by their much maligned opponents.

Now, it is quite plain, that all this party feeling is unwise and unworthy of professional mechanics. We should not be misled by words. There is nothing in the words "long boiler," or "short boiler," that *ipso facto* constitutes an engine either a safe or an unsafe one. A long boiler engine may be a very good one or a very bad one, as a short engine may be. The prejudice and the name should perhaps alike be discarded as likely to mislead.

Our attention has been called to this subject by the recent inquests that have taken place on accidents by railways. In some of them we have observed that much stress has been laid on the phrase "long-boiler engines," as if there were something peculiarly dangerous or bad in any engine with a long boiler. Our opinion, on the contrary, is, after a careful investigation both of facts and principles, that length of boiler is not a source of danger: on the contrary, we believe that both Mr. Gooch's large engine on the broad gauge, and Mr. Crampton's and Mr. Stephenson's on the narrow, all of them long-boiler engines, are perfectly safe.

It may be expedient for the present to confine our attention to the last of these, as it has appeared that one or two of Mr. Stephenson's engines which had long boilers have been exposed to accidents. This is admitted readily, even, we believe, by Mr. Stephenson himself; but what is necessary for our purpose is to observe that because a particular kind of long-boiler engine has been liable to accident, it by no means follows that all other long-boiler engines are also in the same predicament. On the contrary we have found that the cause of the "jumping tendency" of those few engines which met with accident arose from a mal-arrangement and mal-adjustment of wheels, which existed in very few engines, and which was departed from as soon as detected. While, therefore, the public has been deluded into the idea that the long boiler was at fault,

it appears that the arrangement of wheels was the real cause of error. In short, we have been led to this conclusion, that it is the length of coupling in relation to the length of boiler, and the respective weights on the wheels with reference to their relative positions, that taken together make one of the old engines either safe or unsafe—so that a short engine may be unsafe with bad arrangement of wheels, even at low speed, while another with a boiler double the length, and wheels better placed, may be perfectly safe even at the highest speed.

For the purpose of placing the subject before our readers in a satisfactory shape, it may not be inexpedient to enter rather fully into the following particulars and facts regarding the so-called long-boiler engines of Stephenson.

The long-boiler engine is one with tubes of 12 to 14 ft. long, instead of 9 or 10 ft., which is the length adopted in other locomotives. The addition to the length was made to use more profitably the fuel, by the greater reduction of the temperature of the gases evolved by the combustion of the coke before they were emitted from the chimney; thereby evaporating a larger proportion of water per pound of coke than had previously been done. This object was most successfully attained by the reduction of the temperature of the gases at the smoke-box end of the tubes from 7 or 800° to 4 or 500°, and an increased power of evaporation in the proportion of 7 to 9. At the time of this important improvement the extreme length of coupling was supposed to be limited to somewhere about 12 ft. The largest narrow-gauge passenger engines then constructed were 14 in. cylinders, and the greatest speed attained about 40 to 45 miles per hour. Engines with four wheels, overhanging weight before and behind them, as great as has ever been introduced into the long-boiler engine, and a length of coupling of only 7 ft., had been running for years with safety proved to be as great as that of any other class of engine.

In the first class of long boiler engines the wheels were put under the cylindrical part of the boiler, arranged as in other six wheeled engines, having the drivers in the centre, in order that the coupling might be limited, while the more economical length of boiler was adopted. Inside cylinders 14 inches in diameter, and consequently the cranked axle was maintained. The extreme coupling was 11 feet. This class of engine ran with great steadiness and economy even at the then almost unprecedented speed of 55 miles per hour; but was modified, after about four or five had been made, to obtain a more simple construction, which may be called the second class.

This had the cylinder outside, increased to 15 inches diameter, with the plain axle; the same general form in other respects and the length of coupling being maintained. With the increased power of the cylinders of these engines a greater weight was required to be placed on the driving wheels, in order that the force of the steam should be usefully employed in the traction of the train, and it was

found that the bite on the rail, even in ordinary weather, was not sufficient to keep the wheel from skidding. The weight thus placed on the driving wheels was taken principally off the leading pair of wheels, which were those sensitive to any blow that might be inflicted on them by a bad joint or otherwise, and by it lifted from the rails, no longer efficiently steadying the leading end of the engine, which, in fact, oscillated on the pivot of the driving wheels. It was then discovered that this arrangement of wheels was unsuited to engines of the power required for the increased loads and greatly increased speeds then maintained on railroads, and it was abandoned after a small number had been made. Some of these have been permitted to run without the attention to the weighting of the wheels which is so imperatively called for; but a new arrangement, not open to this objection, though maintaining the great advantages of economy and simplicity, has been adopted.

It is necessary, before describing this class of engine, to point out the fact which our experience teaches us, that all engines of great power, whatever the length of boiler may be, having this arrangement of wheels and a coupling which has usually been thought sufficient, have a tendency to rock in the same way as the class of engine we have been describing, arising, we believe, from the same cause. In proof of this it is, perhaps, only necessary generally to draw attention to accidents (engines of this the old class running off the rails) on the Great Western, the Manchester and Leeds, and the Grand Junction railways, which to those who have watched the progress of railway travelling will be a few well known instances out of the many which have really occurred. This has, no doubt, pointed out to the locomotive superintendent of the Great Western the necessity of adapting such a length of coupling as shall effectually neutralize any such tendency—a space (18 feet 6 inches) into which the long boiler (*long* as it has been made by the measurement of the imagination by the repetition of this unmeaning term of reproach) with its fire box might be dropped and suspended.—But to proceed with the description of the long boiler engine, with which we are all most concerned, as being that of which almost all the so called engines have been, and of which all are now being constructed.

This, the third class, has six wheels, the leading pair under the leading end of the engine, with the cylinder between this and the second pair of carrying wheels, while the driving wheels are close to the fire box, and within about 4 feet of the engine. The cylinders are 15 inches diameter, and the coupling varies from 11 feet to 13 feet 6 inches in length. The motion previously described does not and cannot exist with these engines, as the centre wheels have very little weight upon them—acting, as they do, only as a relief to the driving pair of wheels, to which they are placed as close as possible. Of this class there are a very large number running daily, as many as forty being on the London and North Western. The greatest speed

known to have been attained has been by these engines, and we cannot point out an instance, and we have not heard of one, where these engines have, by their uneasy motion, left the rails. The overhanging weight does not exceed that of the four wheeled engines, while the length of coupling is nearly double.

Thus we see that the cry against "long boiler engines" is unwarranted by the facts. The boilers in the Great Western new engines are long boilers, probably the longest in existence; but length of boiler is not in itself a source of danger.

A short boiler engine is, *ceteris paribus*, more dangerous than a long one, if the wheels be similarly disposed. Length of boiler is rather a cause of steadiness and safety, provided it be attended with a long coupling of the wheels, i.e., if it has a proportionably long base to stand upon. The great source of danger, or of oscillation at high velocities, is a wrong disposition of wheels, or an erroneous distribution of weights. By carrying too much weight on any one wheel and too little on another, and with too short a coupling, motion of a dangerous nature may be given to any engine, and this may be done whether the boiler is long or short. The most recent examples we have seen of these engines are smooth in their motion and at high speed steady and safe.

#### ATMOSPHERIC RAILWAY.

According to the following extract from the Plymouth Herald, the atmospheric system is doing better on the South Devon than on the Croydon.

**The South Devon Railway—Atmospheric Traction.**—We have pleasure in stating that the atmospheric mode of traction, which has now been in constant operation for several weeks, works most satisfactorily. In addition to the four extra trains on Monday, three of the regular passenger trains commenced running atmospherically—8 20 A. M., and 12 30 P. M., up, and 9 50 A. M., down, between Teignmouth and Exeter—no delay whatever is experienced by the change of the propelling power. The piston carriage on the down trains runs on to Newton, where it is taken off with the superfluous carriages, and placed on a convenient line to be attached to the up train when required—so that, on arriving at Teignmouth, the locomotive is removed, leaving the piston carriage to start the train when the signal is given; and on the down atmospheric train arriving at Teignmouth, the engine which has to run in front is instantly attached to the piston carriage, and is ready for the start, at all times, before the guard is ready, or the passengers are arranged. The 8 20 A. M. train, on Monday, started from Newton with the piston carriage, three second class, two first, horse box and carriage truck—all laden. On arriving at Teignmouth, the locomotive bade adieu to its burthen; and when the signal was given, the apparently powerless train moved off—to use our correspondent's words—"with an agility as if some superhuman power were concerned in the operation, the long train proceeding on with grace and ease, without any visible cause of propulsion." The different stations were called at as usual, and the train arrived

in Exeter at its proper time. This train is generally heavy, and the taking it on by the new system is a proof of confidence in its operation. The Bath mail up, is taken on by the 12 30 P. M., by atmospheric, from Teignmouth to Exeter. Every train during the past week has worked with the utmost regularity, and the doubts of those who remained unconvinced of the practicability of the system appear now to be entirely dissipated. It is expected that the line to Newton will be opened atmospherically in the course of a fortnight, the apparatus being in a forward state, when it is generally understood that all locomotive power will be dispensed with above Newton.

#### Smelting Copper Ores.

The following is said to be an improved method of smelting copper ores, and as there is very little known in this country, in relation to this department of useful industry—where so much is to be done—we give it, from the London Mining Journal.

In the *Mining Journal* of Feb. 6, we described an improved method of smelting copper, for which Mr. James Napier had taken out a patent: we have now before us a specification of another patent recently secured by the same gentleman, for further improvements in the smelting of such description of ores as he has not provided for in his previous one. In the first plan, when the ore contains little or no sulphur, the calcination described in his previous patent may be dispensed with; and as some copper ores are found to contain sufficient iron, it is not necessary, in such cases, to make any addition of iron, as described in the aforesaid patent. Another part of this specification applies to the treatment of ores containing silver or gold, or both, with alkali, lime, iron, coal, or galena. The first object in this new method is to separate the earthy matters; for this purpose, such an assortment of the ores is made, that the silica shall be in about the proportion of from 50 to 75 per cent.—the other ingredients in the matrix consisting as usual of alumina, lime, baryta, and the fluor-spar; oxide of iron causes the mass to fuse more readily; if the ore, or a mixture of ores, employed, contain less than the above proportion of silica, that proportion must be made up by the addition of sand; and, if the mixture contain too large a proportion of silica, lime or fluor-spar must be added to reduce it to the proper proportion. Should the ore contain iron and sulphur, in the proportion of one of each to two of copper, to every ton of ore is to be added 56 lbs. common salt, 40 lbs. lime, and 100 lbs. anthracite coal; these ingredients are then fused in the melting furnace, the slag and scoria skimmed off, the furnace tapped, the metal run into sand moulds, and the pigs to be treated as hereafter described. Should the ore contain less than one of iron to two of copper, sulphuret of iron must be added to make up the proportion; or, where the mass has been melted, and the slag skimmed off, add 30 lbs. of scrap iron; when perfectly fused, and the iron has disappeared, the furnace is to be tapped, and the copper run out into sand bowls; when the pigs are set, they are thrown into cold

water, in which they become disintegrated, and fall into a fine powder; this powder is left exposed to the atmosphere, and then calcined. The oxide of manganese may be used instead of iron, but iron is preferable; when the ores contain little or no sulphur, the calcination and disintegration may be omitted. Sand or lime, and oxide or carbonate of iron, is now to be added, to bring the silica and other ingredients to the above named proportions, for the purpose of converting the slag into a glass; 80 lbs. of common salt, 50 lbs. of lime, and 100 lbs. of anthracite coal, all finely ground, and to be added to 1 ton of ore, containing 12 per cent. of metal; but should the ore be richer, less salt and lime would be required, and more anthracite. The time for fusing 25 cwt. of the ore would be about six hours; and, should any regulus be produced, it must be afterwards roasted and refined. When the copper ore contains silver or gold, or both, it is to be calcined and disintegrated, so as to bring it to about 50 per cent.; it is then to be mixed with 50 lbs. soda ash, 50 lbs. slaked lime, 1 cwt. anthracite coal, 1½ cwt. scrap iron, and 4 cwt. galena; the whole is now to be fused, the slag removed; and, when the metal has been well tubbed, the furnace must be tapped, and the metal run into pigs. The lead will be found reduced at the lower part of the first and second pigs, and will contain the whole or greater part of the silver or gold previously contained in the ore; from this lead the precious metals may be separated by the ordinary processes, and the copper regulus is then to be re-roasted, and treated over again with fresh ores. Should the ore containing the silver or gold contain no copper, 4 cwt. of copper pyrites is to be added to every 16 cwt. of the ore, and treated exactly as above described.

#### GILLESPIES' WORK ON ROAD MAKING.

A *Manuel of the Principles and Practice of Road making*, comprising the Location, Construction and Improvement of Roads, (Common, Macadamized, Paved, etc.) and Rail Roads, by W. M. Gillespie, Professor of Civil Engineering in Union College. Published by A. S. BARNES & CO., 51 John St., New York.

LINDSAY & BLAKISTON } Philadelphia.  
GRIGG, ELLIOT & CO., }

RECOMMENDATION FROM PROFESSOR MAHAN.

"I have very carefully looked over Professor Gillespie's *Manuel of Road Making*. It is, in all respects, the best work on this subject with which I am acquainted; being, from its arrangement, comprehensiveness and clearness, equally adapted to the wants of Students of Civil Engineering, and the purposes of persons in any way engaged in the construction or supervision of roads. The appearance of such a work, 20 years earlier, would have been a truly national benefit, and it is to be hoped that its introduction into our seminaries may be so general as to make a knowledge of the principles and practice of this branch of engineering, as popular as is its importance to all classes of the community.

(Signed,) D. H. MAHAN,  
Professor of Civil Engineering in the Military Academy of the United States."

THE SUBSCRIBER IS PREPARED TO execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Ralls. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.  
New York.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 feet in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**SPRING STEEL FOR LOCOMOTIVES, Tenders and Cars.** The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**RAILROAD IRON.—400 TONS ENGLISH,** 60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
68 Broad Street, New York.

**FOR SALE—300 TONS (10 MILES) FLAT** Bar Rail, in parcels or wholesale—section 2½ inches wide by ½ thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

L. R. TRIMBLE,  
Wilmington, Del.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
**SHIPPING & COMMISSION AGENTS**

**PASSENGERS, SPECIE, GOODS, PARCELS, etc.**  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise.] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

ROBERT GRACIE

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAML KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE** Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by

JOHN A. ROEBLING, Civil Engineer,  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hickey & Drury, Boston, will be promptly executed.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.

The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Patterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

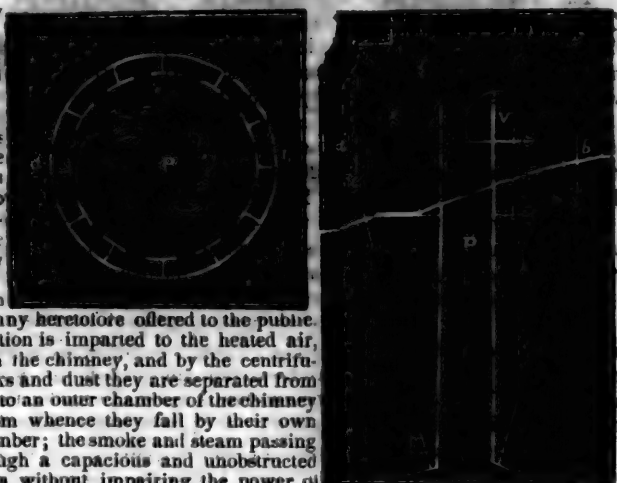

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,

Patterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestles are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestles, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestles for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

#### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,324 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile, including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331

### LAP—WELDED WROUGHT IRON TUBES

FOR

### TUBULAR BOILERS, FROM 1 1-4 TO 6 INCHES DIAMETER, and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,  
Patentee.

1925 28 Platt street, New York.

### RAILROAD IRON.

#### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,  
Pres't, Mt. Savage Iron Works,  
Maryland.

No 23 Pear street,  
1910 near Third, below Walnut,  
Philadelphia.

THE SUBSCRIBER has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

ANDREW MENEELY.

West Troy, May 12, 1847. 1921

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents.

1948 77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 3247

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—cables, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	24 -	50	15-16	90	
13	3½	9 3	8½	16 -	27	11-16	13½	
14	3½	6 11	7½	13 8	17	9-16	10½	
15	2½	5 2	6½	9 4	13½	1-3	7½	
16	2½	4 3	6	8 8	10½	7-16	7	

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,  
Philadelphia, Pa.

1y25

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

1y46

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] WILLIAM ROX, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.  
To all whom it may concern:—This is to certify that the New Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Sup't Motive Power

**THE SUBSCRIBERS, AGENTS FOR** the sale of

Codorus,  
Glendon,  
Spring Hill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAML. KIMBER & CO.,**

39 North Wharves,

Apr. 14, 1846. [1y4] Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**  
\$45 N. E. cor. 12th and Market sts., Philad., Pa.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents,**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847. 10f

**TO LOCOMOTIVE AND MACHINE ENGINE** Boiler Builders. Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 10f

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

MANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1,	15 inches Diameter of Cylinder,	× 20 inches Stroke.
"	2,	14	" " " × 24 " "
"	3,	14½	" " " × 20 " "
"	4,	12½	" " " × 20 " "
"	5,	11½	" " " × 20 " "
"	6,	10½	" " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**KEARNEY FIRE BRICK. F. W. BRINLEY**, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, cash on delivery of brick on board. Refer to

James P. Allaire, } New York.

 Eagle Screw Co. }  
 William Parker, Supt. Bost. and Worc. R. R.  
 New Jersey Malleable Iron Co., Newark N. J.  
 Gardiner, Harrison & Co. Newark, N. J.  
 25,000 to 30,000 made weekly.

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**LAP-WELDED WROUGHT IRON TUBES** for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

**IRVING VAN WART**,  
12 Platt street, New York.

**JOB CUTLER**, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**A. & G. RALSTON & CO., NO. 4** South Front St., Philadelphia, Pa.

Have now on hand, for sale, Railroad Iron, viz: 180 tons 2½ x 1 inch Flat Punched Rails, 20 ft. long. 25 " 2½ x 1 " Flange Iron Rails. 75 " 1 x 1 " Flat Punched Bars for Drafts in Mines. A full assortment of Railroad Spikes, Boat and Ship Spikes. They are prepared to execute orders for every description of Railroad Iron and Fixtures.

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

**REEVES, BUCK & CO.**

Philadelphia.

**ROBERT NICHOLS**, Agent,  
No. 79 Water St., New York.

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

**J. BALL & CO.**

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m., on arrival of the afternoon train from Portland.

**WALDO HIGGINSON**, Agent

**PATERSON RAILROAD** Summer Arrangement.

Commencing April 20th, 1847, the cars will leave  
 Paterson at New York at  
 8 o'clock a.m. 9½ o'clock a.m.  
 11½ o'clock a.m. 12 1-4 o'clock p.m.  
 4 o'clock p.m. 5½ o'clock p.m.

On Sunday.

Office 75 Courtlandt St.

**BALTIMORE AND OHIO RAILROAD.**  
MAIN STEM. The Train carrying the

Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburg and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13½

**LITTLE MIAMI RAILROAD COMPANY.**  
Fall and Winter Arrangement, 1847. On and

after Monday, September 20th,

until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Yellow Springs, and Springfield. Returning, will leave Springfield at 4½ a.m. Upward train arrives at Springfield at 2½ p.m. Downward train arrives at Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore & Co. are running the following stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheeling, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanesville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine & the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, is 32 hours. Distance from Cincinnati to Springfield by railroad.....84 miles.

From Springfield to Bellefontaine by stage, over a good Summer road.....33 "

From Bellefontaine to Sandusky city by railroad.....102 "

FARE—From Cincinnati to Lebanon.....\$1 00

" " " Xenia.....1 50

" " " Springfield.. 2 00

" " " Columbus.. 4 00

" " " Sandusky city 7 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at a passage for every \$500. in value over that amount.

47W W. H. CLEMENT, Sup't.

**BALTIMORE AND SUSQUEHANNA**  
Railroad.—Reduction of Fare. Morning and

Afternoon Trains between Balti-

more and York.—The Passenger trains run daily, except Sunday, as follows:

Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....9 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.  
Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**

Returning, leaves Owing's Mills at.....7 a.m.

D. C. H. BORDLEY, Sup't.

34 1y Ticket Office, 63 North st.

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1-25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 351y

**CENTRAL AND MACON AND WEST-ERN**  
Railroads, Ga.—These Roads with the

Western and Atlantic Railroad

of the State of Georgia, form a

continuous line from Savannah to Oothcaloga, Ga.,

of 371 miles, viz:

Savannah to Macon—Central Railroad.....Miles 190

Macon to Atlanta—Macon and Western.....101

Atlanta to Oothcaloga—Western and Atlantic.. 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....\$0 50 To Atlanta To Oothcaloga \$0 75

Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....0 50 0 62½

On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....0 30 0 26

Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....0 20 pr. 100lbs. 35

Crockery, per cubic foot.....0 15 " 35  
Molasses and Oil, per bhd., (smaller casks in proportion). 9.00 13 50

Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....1 25 1 50

Ploughs, (small,) and Wheelbarrows.....0 80 1 05

Salt, per Liverpool Sack.....0 70 0 96

Passage—Savannah to Atlanta, \$10; Children, under 13 years of age, half price, Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

P. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH**  
to Macon. Distance 190 miles.

This Road is open for the trans-

portation of Passengers and Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally... 50 cts. per hundred.  
On measurement goods..... 13 cts. per cubic ft.

On brls. wet (except molasses and oil).....\$1 50 per barrel.

On brls. dry (except lime)... 80 cts. per barrel.

On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred.

On hhds. and pipes of liquor, not over 120 gallons.....\$5 00 per bhd.

On molasses and oil.....\$6 00 per bhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**  
Passenger Train runs daily from Charleston,

on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$25 50

Fare through from Charleston to Huntsville, Decatur and Tuscumbia..... 22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**  
Railroad.—This Road is now in operation to

Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,  
Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAIL-**  
road line—direct. Via Newark, New Brun-

wick, Princeton, Trenton,

and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.

Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00

Second class cars..... 3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m., and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily, except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York.

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville,	92	\$3.50	and \$3.00
" " Reading,	58	2.25	and 1.90
" " Pottsville	34	1.40	and 1.20

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

# PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.

Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3 p.m. No line on Sun-Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12 p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4 p.m., 7 p.m., 12 p.m., night mail.

J. R. TRIMBLE,  
Engineer and General Superintendent.

# GEORGIA RAILROAD. FROM AUGUSTA to ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA to DALTON, 100 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 408 miles in length, from Charleston to Dalton (Cross Plains) in Murray county, Ga.—32 miles from Chattanooga, Tenn.

## RATES OF FREIGHT.

	Between Augusta and Dalton. 271 miles.	Between Charleston and Dalton. 408 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 18	\$0 28
2d class. Boxes and Bales of Dry Goods, Sadlery, Glass, Paints, Drugs and Confectionary, per 100 lbs.	1 00	1 50
3d class. Sugar, Coffee, Liquor, Bagging, Rope, Cotton Yarns, Tobacco, Leather, Hides, Copper, Tin, Feathers, Sheet Iron, Hollow Ware, Castings, Crockery, etc.	0 60	0 85
4th class. Flour, Rice, Bacon, Pork, Beef, Fish, Lard, Tallow, Beeswax, Bar Iron, Ginseng, Mill Gearing, Pig Iron, and Grindstones, etc.	0 40	0 65
Cotton, per 100 lbs.	0 45	0 70
Molasses, per hoghead.	8 50	13 50
" " barrel.	2 50	4 25
Salt per bushel.	0 18	
Salt per Liverpool sack.	0 65	
Ploughs, Corn Shellers, Cultivators, Straw Cutters, Wheelbarrows...	0 75	1 50

German or other emigrants, in lots of 20 or more, will be carried over the above roads at 2 cents per mile.

Goods consigned to S. C. Railroad & Co. will be forwarded free of commissions. Freight payable at Dalton.

F. C. ARMS,  
Supt. of Transportation.  
Augusta, Ga., July 13, 1847.

## RATES OF FREIGHT

On CHANDLER'S Through Transportation Line, between Charleston, S. C., or Savannah, Ga., and Decatur, Ala., and Knoxville, Tenn., and all intermediate points on the Tennessee River, viz:

Between Macon and Decatur and intermediate points.	0 22 1/2	1 54	1 10	1 05	0 76	0 86
and Knoxville & intermediate points.	0 22 1/2	1 54	1 10	1 05	0 76	0 86
and Chattanooga.					0 61	0 90
Between Augusta and Decatur and intermediate points.	\$0 21 1/2	1 70	1 15	1 20	0 85	0 90
and Knoxville & intermediate points.	\$0 21 1/2	1 70	1 15	1 20	0 85	0 90
and Chattanooga.					0 65	1 10
Between Charleston or Savannah and Decatur and intermediate points.	\$0 22 1/2	2 20	1 40	1 35	1 05	1 10
and Knoxville & intermediate points.	\$0 22 1/2	2 20	1 40	1 35	1 05	1 10
and Chattanooga.					1 00	1 10
					0 85	

1st class.—Boxes of Hats, Bonnets and Furniture per foot.....  
2d class.—Boxes and Bales of Dry Goods, Shoes, Saddlery, Glass, Paints, Oils, (in cans) Drugs, Confectionaries, Shovels, Spades, Seythes, Smiths' Bellows, Baskets, Tubes, Sticks, Brooms and other light articles, per 100 lbs.  
3d class.—Molasses, Sugar, Coffee, Liquor, Bagging, Rope, Cheese, Tobacco, Leather, Feathers, Hides, Wool, Copper, Tin, Sheet-iron, Nails, Casts, or Grates of Crockery, Hardware, and other heavy articles not enumerated below.  
4th class.—Flour, Bacon, (in casks or boxes) Pork, Beef, Lard, Tallow, Butter, Beeswax, Bales of Rags, Ginseng, Green and Dried Fruit, (in casks or sacks) Pig-iron and Lumber, per 100 lbs.  
Per 100 lbs. Cotton.

Merchandise shipped from any of the northern ports, must be consigned to R. R. AGENT, CHARLESTON, S. C., or R. R. AGENT, SAVANNAH, GA.: and every package must be marked, care of B. CHANDLER, Chattanooga.

Charges will accompany the goods, and be collected by the boats on the Tennessee river, when delivered to the owner or consignee.

No preference in the way of despatch, will be given to any produce intended for their line, but each lot will be sent off as it is received.

The warehouse of the undersigned will be enlarged during the summer, and an apparatus attached for hoisting or lowering freight to the river, without soil or injury.

He will have a train of wagons under his entire control, sufficient to conduct the fall business with great despatch.

B. CHANDLER.  
Chattanooga, Tenn., July 1, 1847.

## REGULAR RATES BETWEEN ATLANTA AND CHARLESTON OR SAVANNAH.

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.  
The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,  
103 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

### AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA

Saturday, October 30, 1847.

#### To Contractors—Pennsylvania Railroad.

The following notice from the Pennsylvania railroad company, will be received by the community as another evidence of the determination of those who have the direction and management, to press on the work in the most efficient manner. Thirty miles were put under contract in July, and the work has been going on in an efficient manner upon the sections then let, fifteen miles westward from Harrisburg and fifteen miles eastward from Pottsville. Now the letting is to be thirty-six miles westward from Section 20—or from the termination of that let in July last, west from Harrisburg—to near Lewis-town Dam, making forty-six miles continuous from Harrisburg.

We understand that it is the determination of the directors of this company to accomplish the work entrusted to their charge in the shortest possible period, and we hesitate not to say that, when completed, the people of Philadelphia will owe more of their prosperity to it, than to all their other public works combined.

**PENNSYLVANIA RAILROAD COMPANY**  
Notice to Contractors.—Proposals will be received until THURSDAY, the 30th day of November, at 10 o'clock A. M., at the Town Hall, in the Borough of Lewistown, for the grading and masonry upon about 36 miles of the Pennsylvania Railroad, extending west from section 20 to near Lewis-town Dam.

Plans and specifications of the work can be seen at the above named place for five days previous to the time appointed for receiving bids.

Any further information can be had upon application to WM. B. FOSTER, Jr., Esq., Associate Engineer at Harrisburg. S. V. MERRICK, President.

#### Schuylkill Coal Trade.

#### Railway Cars and their Improvements.

We referred, in our last number, to a beautiful railway car, built by Davolport & Bridges, which we saw at the Fair in Boston; but we did not refer, as we intended when we commenced the paragraph, to another beautiful and commodious car, upon the Boston and Maine railroad, in which we had a seat to Portland. The car alluded to has what are termed "air springs"—but, we were told by Mr. Minot, the very efficient superintendent of the road, they are of a kind superior to those heretofore used, and much less likely to get out of order. This car was one of the largest size of 8-wheel cars, and is finished in a superior manner, both in point of beauty and durability—a point very essential to those who have to pay for them. It was built, we were informed, in the shop of the company at Andover—where they build and repair all the cars used on the road.

To an admirer of the railway system—at least to one who has watched its rise and progress—a visit to Boston is a season of pleasure and delight; and, however much other companies and their improvements may contribute to his pleasure, none deserve more of his admiration than the rise and progress, and present condition, of the Boston and Maine—when we consider that it has a rival road, and a good steamboat line to the point of its termination. It has been built in parts, but it now forms an entire line, between Boston and Portland, with spacious depots,

engine house of great capacity, and machine shop adjoining at Boston, with car shops at Andover.—The management of the road appears to be equal to any of the New England roads; the business and income has increased immensely the current year, over any preceding year, and we are fully of the opinion that they will be obliged soon to lay a double track from Boston to the new city of Lawrence, and also for several miles at the half way, or meeting point, to avoid detentions of the trains.

#### Winter Freight for Railroads.

"The pork packers at the west are generally prepared for the operations of the season, and at Cincinnati, on the 13th inst., says a Pittsburg paper, the prospect was favorable for an early commencement. At St. Louis, it was calculated the market would open at about \$3 and \$3 50 per 100 pounds, with a fair supply of good hogs upon the market."

"The pork packers of the west" will find a new era open upon them when there is a continuous railroad from them to a market. Then the hogs will be carried in carcase to the salt and the barrels—and thus save a considerable expense to the consumer—then we shall see the fat porkers of the west coming to us by thousands as large as life.

#### Increase of Receipts on Railroads.

We are pleased to learn that the increase of business on railroads has not been confined to any one section of the Union, but that it is universal. We are informed that the receipts during the past ten months, upon the Central, Georgia, road has been about \$100,000 greater than for same period last year—and for the year it will probably amount to \$190,000.

#### Railway Brakes.

We frequently hear of serious accidents to railway trains for want of brakes of sufficient power to arrest its progress. We have often called attention to this subject, and urged it upon ingenious men to devise a brake which might be applied to every wheel in the train at the same time by a single motion, or power; and we have reason to believe that other, and abler minds, have deemed it of sufficient importance to devote their attention to it, from which we anticipate much benefit.

We some time since copied from the London Mining Journal, of August 14th, an article on the subject, and we are now informed that a gentleman of this city is also perfecting a model, for the same purpose.

\* See September 24th.

pose, which we are told will fully accomplish the object; and we hope soon to be allowed to give a description of it.

#### Androscoggin and Kennebec Railroad.

We learn from the Waterville Mail, that this whole road, including the bridge, is now under contract. The three sections from Winthrop village north, were let to Mr. Warren, of Pownal; the next five sections to Wm. Phelan, of Salem; the next to Messrs. Wall, Sanders & Co., of Waterville and Winslow; the remaining two sections at the Waterville end of the road, are let to Gerty & Fitzsimmons; the bridge across the narrows is let to Messrs. Emerson & Conner, of Fairfield; and that across the Emerson stream, to Mr. Scammon, of Waterville. We learn that the work on all these sections is to be commenced during this week. A portion of the pay for grading, in all instances in the above lettings, is to be taken in stock. A gentleman who has just returned from Lewiston, and who has been over the entire line between the junction and Winthrop, says, that on every section heretofore let, up to Winthrop village, there are several companies of men at work. The grading is pressed with all possible speed, and on several sections a large portion of the work is done. The stone for the masonry of the Great and Little Androscoggin bridges, has all been split out and is ready to be laid. We are gratified to hear of these operations and also of the progress made on those sections heretofore put under contract.

#### Pennsylvania Public Works.

##### Comparative Income of 1846 and 1847.

The following statement, from the Harrisburg Union, shows the amount of tolls received on the canals and railroads of this State, during the month of August, and the total receipts from 30th November, 1846, to 1st September, 1847.

Offices.	For August.	Total since 30th Nov.

		<b>\$1,211,373 09</b>

But for the unfortunate interruption of navigation by the late storm, the receipts for the whole year would probably have reached \$1,600,000—as it is,

there is reason to fear that it will not exceed a million and a half; yet with only that amount of gross receipts, it will exceed those of last year by nearly, or quite, \$300,000, which is encouraging to the people of Pennsylvania to meet the interest upon their debt promptly, as a similar increase for a few years more will relieve them from taxation to pay interest.

#### Railway Car Builders.

The question has been often asked us "Why is it that we have no establishment in Philadelphia, or its vicinity, for building railway cars?" No place in the Union has built as many locomotive engines as Philadelphia. Scarcely a road in the Union but has been indebted to our shops for locomotives, yet no cars bear the mark of "Philadelphia?"—and why not? It seems to us that there is no point in the Union which offers greater inducements for a first rate establishment in this line than Philadelphia;—and we therefore suggest it to the enterprising young men in the line to look to it. It is a field worth cultivating, and it will not long remain unoccupied.

Notwithstanding the extensive establishment of Davenport & Bridges, at Cambridgeport, Gilbert & Eaton, of Troy, and another at Worcester, Massachusetts—there is to be another, as we learn from the Norwich Courier, at Norwich, Connecticut, on a large scale, thus showing that the business is considered by the shrewd men of that region not yet overdone.

The following description is taken from the Norwich Courier, of 16th inst., and the establishment is, we understand, to be under the direction, in whole, or in part, of Mr. James D. Mowry.

"*Norwich Car Manufactory.*—We always hail with much satisfaction the establishment in our city and town of any new branch of manufacturing or mechanical business, since to these sources it is we must mainly look for that productive labor which adds to the real substantial wealth of the community. We dare say a large portion of our citizens are quite ignorant of the fact, that an establishment for the manufacture of railroad cars of all descriptions, and of locomotive engines, is in progress of rapid completion in this city. Many of our readers no doubt have noticed two long brick buildings which have been, for some time past, going up on the south side of the road leading to Greenville. These are the buildings of the "*Norwich Car Manufactory.*"—One of these is to contain the workshops, as they are called; the others for upholstering and setting up the cars. The former is about 200 feet long, and some 50 in width—the second 150 in length, 50 in width, and three stories high. Quite a number of brick tenements, also, for the accommodation of workmen connected with the establishment, are going up simultaneously with the other buildings.

"The number of hands to be employed in the car building department is about 200, and the company hope to be ready for action in the course of four or five weeks from the present time.

"The department for building locomotive engines is not to go into operation until the other branch of business is well under way. It is to follow in due time in regular order, however. And when the whole concern is got in motion, what with planes, saws, chisels, mallets,

'The clink of hammers closing rivets up,' and all the other machinery in full blast, we incline to think such another babel will be hard to find any where in Norwich. Success to the enterprise, say we! No more eligible spot could be found in all New England for an extensive establishment of the sort. Every possible facility for sending their cars and locomotives in any and all directions, will be

enjoyed by the company. Look for instance at the vast net work of railroads in Massachusetts, New Hampshire and Vermont, which furnish at once the means of transportation, and create a demand for the products of these workshops. As an illustration of the amount of business which the Norwich car manufactory may reasonably anticipate, we may state that we are informed by one of the company, that already since the formation of the company, contracts to the amount of not less than two hundred thousand dollars, for railroad cars, have been offered them."

There is also a new car manufactory recently established at Springfield, Massachusetts, by Messrs. T. & C. Watson, of which we have recently heard, and expect to hear more soon.

#### Baltimore and Ohio Railroad.

##### Twenty-first Annual Report.

We find, in the Baltimore American, the 21st annual report of this company. It is given in the full and lucid manner of the able president of the company, and will be read with deep interest by all who are in any way interested in the success of the noble work, or are familiar with the difficulties which it has had to encounter, and which it is sure to overcome; and therefore we give it a place in the Journal without delay—and refer our readers to it for the interesting facts it puts forth, rather than to any remarks of our own.

We cannot omit, however, to refer to the statement of the falling off in the revenue of the Washington Branch, since the last reduction of rates.—We hoped for a different result, though we freely admit that there are many other lines in this country where a reduction of fare would be more likely to increase receipts than on the line between Baltimore and Washington.

At a meeting of the stockholders, held pursuant to the charter, on the second Monday of October, 1847, in the city of Baltimore, the President and Directors of the Baltimore and Ohio Railroad Company submitted the following report and statement of the affairs of the company:

#### FIRST, OF THE MAIN STEM.

The statement of A shows the state of the company affairs on the 30th ult., and the revenue and expenses of the main stem for the year ending on the same day are shown by the statement B.

These statements exhibit a considerable increase both in the trade and travel; and it will appear from an examination of the various items of which they are composed, and from the elaborate report of the Chief Engineer, acting as General Superintendent, here appended, that in proportion to the amount of business, there has been a very favorable diminution in the cost of transportation and expenses of working. The general economy in the management of the road, either in regard to its particular condition, or as compared with other roads in the United States, or elsewhere, though more favorably situated, is also worthy of particular notice, and ought not to escape the attention of the stockholders.

The gross receipts from the business of the main stem, independent of its connection with the Washington road, amount to the sum of \$1,101,936 58, and the expenses of working and management, of all kinds, to the sum of \$590,828 26, little more than 50 per cent. of the gross receipts, and leaving a balance of

net earnings, over all expenses of working, of \$511,107 60, being more than 74 per cent. upon the capital. Without reference to the detailed statements and observations in the report of the chief engineer, and to the subsequent remarks in this report, or to the working of other similar roads, this result would establish the general economy in the administration of this work, and show that the cost and expenses of transportation bear a reasonable and economical proportion to the entire receipts from trade and travel. If, therefore, there were no other objects to which the board were under an obligation to apply the above stated net receipts, the dividend for the past year, under the present system of management, might not have been less than seven per cent., and the necessity of applying them to other objects, however it might be regretted, has been altogether unavoidable.

The stockholders were informed in the last annual report that engagements, made prior to the month of September, 1846, for reconstruction of 30 miles of the old track, for new locomotive engines, for new burthen cars, and for improvements at the several depots, stated in that report at \$325,000, would be chargeable upon the receipts of the year just closed—and that by the interest upon the bonds then authorized to be issued, and the installment payable during the year to Messrs. Barling, Brothers & Co., the amount so chargeable would be swelled to an aggregate of not less than \$418,000.

It is now to be observed that the payments during the year on account of all the foregoing items have actually amounted to the sum of \$403,662 63, and that from the receipts of the year there has also been paid, on account of surveys west of Harper's Ferry, for interest on temporary loans, rendered necessary to meet the engagements of the previous year in anticipation of the accruing revenue, and for additional burthen cars, indispensable to comply with the more pressing demands of the increasing trade, the further sum of \$37,534 10.

Of the net earnings, as shown above, not expended on account of capital, and which it is in the power of the board to replace by the sale of their six per cent. bonds, the board have declared a dividend of three dollars upon each share, and applied the further sum of \$20,000 to the sinking fund provided, as stated in former reports for the reimbursement of the loan of \$1,000,000—on account of the Washington road, leaving a surplus to be reimbursed from the cost of reconstruction by the sale of bonds of \$23,916 50.

It ought also to be observed that while, from the causes already explained, the dividend of the city and individual stockholders does not exceed three dollars per share, the State of Maryland has derived much greater advantages from her connection with this enterprise. The subscription of \$3,000,000 made by the State in 1836, with a distinct understanding that both the city and state should at the time contribute an equal sum, was paid in five per cent. sterling bonds; and that, although the subscription by the city has been fully realized and applied to the construction

of the road to Cumberland, yet, that in consequence of the depreciated credit of the State, the sterling bonds received from the treasurer have remained for the most part unavailable. Of the entire sum of the \$3,000,000, an amount not exceeding five thousand pounds sterling have been disposed of and while the company has continued regularly to pay the interest upon that amount to the bondholder, the State, during the whole period, has annually received larger sums from the company than any other stockholder.

During the past year, including the bonus, the State has received, from the earnings of the Washington road, an amount equal to 10 per cent. upon her subscription to that road—and with the dividend from the earnings of the main stem, the State has actually received a sum equal to seven per cent. upon her investment in both roads.

Of the revenue heretofore applied to reconstruction, the board have replaced during the year the sum of \$49,105 12 by the sale of their six per cent. bonds, at prices averaging about their par value; and it may be added, that by the consent of the city authorities to receive the present dividend, payable to the city, in the same securities, the board will be enabled to make a further sale of the same description of bonds to the amount of \$105,000, at their par value.

It is proper also to state, that during the past year the board have entered into contracts, within the estimates of the engineer, for the further reconstruction of 31 miles of the old track, payable partly in the company's notes at long credit, and partly in the six per cent. bonds alluded to in the last annual report, at par; and that they have also entered into contracts in the further amount of \$152,872, being \$46,000 less than the cost estimated by the chief engineer, for indispensable alterations in certain parts of the old track, payable altogether in similar six per cent. bonds of the company at their par value.—For so much of the foregoing engagements as are payable in the notes of the company, the board must rely ultimately upon the sale of an additional amount of six per cent. bonds, or upon loans in some other form, and until one of these can be effected upon favorable terms, upon the current receipts of the business of the road. The effect, therefore, upon the dividend of the current year must depend upon the success of one of the first resources.

A proper regard to the increased trade and travel upon the road, and to its economical working, and, what is even of greater importance, to the safety of the public, would not permit a thorough reconstruction of the old and imperfect track to be longer delayed.—By some, or all of the resources at the command of the board, these objects must be accomplished with the utmost possible despatch—and the duty of the board will only be discharged by accomplishing them according to their best judgment, with all the means at their command, and in a manner the least onerous to the stockholders.

Up to this time, it is not doubted that an impartial examination of the subject will satisfy the stockholders, that in the discharge of

the arduous and multifarious duties devolved upon the directors the board have practised a due economy and carefully guarded the interests entrusted to them.

The exhibition they are now enabled to make of a net earning of more than seven and one-quarter per cent. upon the capital, over and above all the current expenses of working and management, including extraordinary repairs of the roadway, bridges and machinery of all kinds, is not only a conclusive evidence of the economy with which their duty has been performed, but ought to afford substantial evidence of the future profits of the work, and of the stability of the company's credit.

This part of the subject, however, cannot be properly understood or appreciated, nor will the stockholders be able to do justice to the present condition or future prospects of their own enterprise, nor properly sustain its credit, without bearing in mind that their work is, and for some time must remain in an unfinished state—unfinished, not so much in regard to the termination to which it is designed ultimately to extend it, but, what is equally important, and to the present occasion more pertinent, unfinished in regard to its capacity and power of operation throughout the present line. It would be a grave error, lending to serious and perpetual misapprehension to conclude that a railroad actually constructed between two given termini, was thereby finished and requiring no farther expenditure from the application of its resources to the purposes of capital. A railroad can be said, in no sense, to be finished until it is not only constructed and open for trade between two given points; the road must be considered as unfinished until it can be supplied with all the power and machinery of every description necessary to accommodate the public, and effectively and economically to conduct its daily operations. In all railroad companies in all countries this obvious view of the subject is universally conceded and acted upon, and everywhere the cost of a road and of all other objects comprehending its capital, is understood to include, not only the actual construction of the roadway, but the supply of all the stations, depot buildings, engines, cars and machinery of all kinds necessary to its effective operation. Until, therefore, a railroad is not only actually constructed, but provided with all that is necessary for its effective working, it must remain unfinished, and while it is the duty of the company to proceed to finish the work in their charge with all proper energy, the only means by which it can attain that object is an increase of its capital by new subscriptions, or by some form of loan for the reimbursement of which both principal and interest, the annual receipts are the only resource. The stockholders will scarcely need be informed, therefore, that not only the present road from Baltimore to Harper's Ferry, in consequence of the radical imperfection and defectiveness of the original construction, is yet unfinished, requiring a large annual expenditure to complete it, but that in regard to the necessary stations, depot buildings, and cars and machinery of every des-

cription, the whole work is yet unfinished, and on this account annually absorbing a considerable portion of the receipts to supply the defects. It must, then, be apparent that any unfavorable disposition between the rate of the dividends and the amount of the net earnings can in no degree be attributed to improper expenditure in the working, but arises wholly from an unavoidable necessity of applying so large a proportion of the receipts to put the road in a finished state, to adapt it to the just demands of the trade, and to render it ultimately profitable to the stockholders. It is seen that during the past year under the present economy, if the defectiveness of the road and inadequacy of the machinery had not required such a heavy expenditure, the net earnings of the year would have justified a dividend to the stockholders of seven and a quarter per cent., and yet, in consequence of the necessity of such an expenditure, the board have been compelled to confine the dividend to three per cent., and temporarily to apply at least four per cent. of the net earnings towards completing the work.

It may not be out of place in this connection, and for better illustration of this part of the subject, to state that from the opening of the road to the year 1837, inclusive, (a period of 8 years) the gross receipts amounted to \$1,439,151, the expenses to \$1,038,818, the dividends to \$144,138, and the expenditure on account of capital only to \$247,195.—From the close of the year 1837 to the end of 1847, the gross receipts have been \$5,979,097, the expenses \$3,332,783, the dividends \$735,000, and the expenditure on account of capital \$1,911,314. So that from the opening of the road to the present time, the stockholders have received from its earnings \$879,138, and the expenditure for general objects of capital has been \$2,158,509. The ratio of expenses to receipts prior to 1837 was 72.7 per cent., and from 1837 to 1847 the ratio has been 55.7 while the excess of current receipts over current expenditures prior to 1837 was \$391,333, and subsequent to 1837 it has been \$2,158,500.

In yielding to the necessity which has thus been explained, the board have only followed the example of all others engaged in the management of similar works, practising, as they believe, not less economy than any other administration of railways that they might be required to imitate; and while it may be expected of the public at large to be satisfied with so liberal a provision for the accommodation of the business, the stockholders, in view of the ultimate benefits to flow from it, will, it may be hoped, be content with a policy dictated no less by the necessity of the case, than their own duty and true interest.

The result of this policy, and the economy with which it has been carried out, as well as the beneficial effects upon the interest of the stockholders may be seen in the progressive improvements in their own enterprises, and in its present condition and future advantages.

The influence of the administration of the present board cannot be traced to an earlier period than the middle or close of the year

1837. In that year the length of the road being 82 miles, only 157,102 passengers and 66,703 tons of freight were carried in the cars, and the machinery imperfectly adapted to that amount of business; in the present year upon a road of 178 miles, there have been transported 288,674 passengers and 263,334 tons, and unless from sudden accumulation at unexpected and temporary periods, there has been no deficiency of power or means. Anterior to the year 1837 and up to the year 1835, there had been only five small dividends varying from 37½ cents to \$1 12½ per share, and from 1835 to 1840 no dividend had been declared.

In 1837 the outstanding current obligations of the company were not less than \$130,000, and the aggregate expenses of working the road only, was at least 95 cts. in the dollar! As might have been expected from this result the power and machinery of the company were inadequate even to the inconsiderable business of that period; and only \$750,000 of the original subscription remained unpaid, and that must in a few years only have been needed for the payment of debts and for the augmentation of machinery, leaving other objects of expense swelling beyond any resources at the command of the company.—How long, under a continuance of such cases, the road could have been kept in operation it would now be needless to conjecture. At the end of the year 1840, a period of two years, the remaining capital had been called in, punctually paid and applied to the reduction of the inclined planes at Par's ridge, to the removal of other sources of perpetual and wasting expense, and to the augmentation of machinery of all kinds. During the same time an improved system of repairs of roadway and machinery was adopted, the outstanding obligations of the company were fully discharged, and a dividend of two dollars per share was paid to the stockholders out of the net earnings. During those two years the construction of the road west of Harper's Ferry was commenced under circumstances in many respects unpropitious, and as early as the month of November, 1842, from the proceeds of the city subscription of 3,000,000 and the application of a considerable portion of the annual receipts, was completed as far as Cumberland, a distance of 96 miles, at a cost of not less than 3,623,606 28.

During the period subsequent to 1837, a dividend to the stockholders was intermitted for a single year only, the earnings of the year 1842 having been applied to the extension of the road from Harper's Ferry to Cumberland. In 1841 and 1843 the dividend was \$2 per share, in 1844 \$2 50 per share, and in 1845 and 1846 \$3 per share.

The comparative progressive improvement in other respects during the same period subsequent to 1837 is not less striking. In that year the company owned only 14 locomotive engines, and these of the fourth or smallest class, of which some were actually unfit for use, and the whole, more or less, in an imperfect condition. From that time to the present the motive power of the company has been increased by construction or otherwise

of 13 of the largest class, 2 of the second, 12 of the third and 11 of the fourth class, in all 38, and in actual capacity equal to 72 of the class of those employed in 1837. The augmentation and improvement in the number and condition of the cars and other machinery may be taken to be in the same proportion.

In 1837 the cost of repairs of road and bridges, the latter being comparatively few in number, was not less than at the rate of \$1,203 per mile of road, and at the end of 1846 before the occurrence of the adventitious and temporary causes adverted to and explained in the report of the chief engineer hereto appended, notwithstanding an increase of nearly three-fold in the business of the road, and a considerable addition to the number of timber bridges, the cost of similar repairs did not exceed \$918 per mile of road, being about 25 per cent. less than at the former period. The cost of repairs of machinery, engines and cars, in 1837 was at the rate of 20.3 cts. per mile run by the locomotives with trains, and in 1846 the cost did not exceed 16.1 per mile run; being little more than one-half of the former cost, although the trains hauled in the last year were in all instances considerably larger. In 1837 the aggregate expenses of working the road, exclusive of the expense of horse power in the streets of Baltimore, and over the old inclined planes at Parr's ridge, was at the rate of not less than 173 cents per mile run by the locomotives; and in 1846 the same expenses did not exceed the rate of 50.8 per mile, nearly two-thirds less than in the former period.

It has been already stated that the proportion of the expenses of working the road to the gross receipts in 1837 was as much as 95 per cent.; and it may now be added that in 1846 the same expenses did not exceed 53 per cent. of the gross receipts. It must be observed, moreover, that this great reduction has been effected under the influence of a vastly augmented trade, of a continued dilapidation of the old and imperfect track, of a considerable multiplication of timber bridges and of a reduction in the charges for transportation of more than 35 per cent. below the rates of 1837.

Excepting in Great Britain, where the rates of charges are high and the wages of labor low and where the receipts from passengers, always the chief source of profit on railways, are much greater in proportion to those from burthen transportation, the expenses of working railways rarely if ever fall short of 60 per cent. of the gross receipts, and in most parts of the continent of Europe and elsewhere, they more frequently exceed that ratio. It is to be observed, moreover, that this proportion is seldom or never maintained except in the instances of new and well constructed railways with the most improved rail and form of structure, and with the aid of other advantages indispensable to the cheap management of such works, and where the receipts from profitable passenger travel considerably exceed those from the transportation of burthen. Independently of the railways in England, the ratio of expenses of the gross

receipts, and the economy in the working of the Baltimore and Ohio railroad, will be found to compare most advantageously with all the European works, the former being less and the working cheaper than upon the European works.

The roads in New England possess most of the advantages of newness and strength of construction, of liberal charges and large trade, and from the density of a general and manufacturing population derive larger receipts from passenger traffic than from tonnage; and are also universally conceded to be conducted with commendable regularity and economy. They possess besides many material advantages peculiar to that part of the Union which would enable them to attain a superiority over even the skill and economy of European works, which it would be difficult successfully to imitate.

With all these advantages, an investigation into the comparative cost and expenses of working the Baltimore and Ohio railroad, and of the principal New England roads, according to information derived from authentic sources would still further illustrate the economy with which the operations of this road have been conducted.

The average cost per mile of 12 of the principal railroads of New England, including their necessary equipment, may be stated at \$46,000, and that of the Baltimore and Ohio railroad, including the 30 miles reconstructed during the past and preceding years, may be taken to be about the same. If the cost of reconstructing the remaining portion of the old track, and of the alterations now in progress, be added, the average cost of the road would be more than \$50,000 per mile. The average of all the expenses upon 11 of the principal New England roads per mile run by the locomotives with trains, during the year 1846, was not less than 78 1 cents; and that upon the Baltimore and Ohio railroad during the same period, exclusive of the cost of horse power in the streets of the city, was, as before stated, not more than 89 8 cts. showing a difference of nearly 25 cents in favor of this road.

The average of the proportion of expenses to the gross receipts upon the 11 New England roads, during the year 1846, was a fraction over 50 per cent., and that of the Baltimore and Ohio railroad, during the same period may be stated at not more than 52 per cent. If, in regard to this part of the comparison, the superior construction and comparative newness of the New England road, their exception from the employment of horse power in cities, and the greater amount of passenger traffic in proportion to that of burthen be taken into consideration, (that on the Baltimore and Ohio railroad being \$654,916 14 from tonnage, and only \$447,020 14 from passengers) the cheapness of working the road could not be denied. Of all these facts, and grounds of comparison therefore, it may be safely predicated that, as soon as the old track of the Baltimore and Ohio railroad shall be thoroughly reconstructed, and by an adequate provision of motive power and other machinery and of depot buildings, necessary

for its general purposes, the entire road shall be placed in a finished state, the general expenses will not exceed the best economy upon any other work.

Notwithstanding, however, the confidence of the board in the results already adverted to, and in the general system of management gradually adopted subsequent to the year '37, they have not been insensible to the necessity of adapting it, from time to time, more perfectly to an extended road, to a rapidly increasing trade, and to the great augmentation of power and machinery demanded by the increasing business. The accumulated business in the year 1846, and the new approach of the periodical renewal of the timber of the road over its entire line, presented an appropriate occasion to revise the general system of management, and in the month of November last the president suggested a scheme of a modified system and invited the attention of the board to the necessity of a particular examination into the present organization of the company, and to the introduction of some reforms which he thought might be advantageously made.

He also asked the appointment of a committee by whom he might be assisted in the investigation, and in maturing the reforms that might be deemed expedient. The principal objects to be attained by the proposed modifications consisted in confining the general supervision and superintendence of all the departments nearer to their duties, and, by a judicious subdivision of labor, to insure a proper adaptation and daily application of the supervisory power to the objects under its immediate charge; in the multiplication of checks, and to effecting a strict responsibility in the collection and disbursement of money; in confining the company's mechanical operations in their shops to the purposes of repairs rather than of construction; in promoting the economical purchase and application of materials and other articles needed in every class of the service; and in effecting a strict and more perfect responsibility in the accounting department generally.

After diligent investigation, with the aid of the experience of other roads in New England and elsewhere, the committee proposed to attain the foregoing objects by confiding the departments of transportation, of the construction and repairs of the road, and of the repairs of machinery to a separate superintendence, under the immediate supervision of the chief engineer acting as a general superintendent over the whole.

They also subjected all these officers and all other principal agents to an annual appointment, and required satisfactory security for the faithful performance of his duties from each. They also adopted measures for the purpose of confining the receipt of money to as few agents as possible, and for ensuring the prompt payment from all of moneys received by them; and they prescribed a new and securely guarded system of tickets recommended by the best experience in other companies, and adopted checks upon conductors and other agents which were thought would prove effective in enforcing a rigid ac-

countability from all. They revised and re-modeled the system of accounts, and by bringing them into the company's office, effected a daily accountability and settlement of the account of each of the agents by the treasurer and secretary under the immediate supervision of the president.

It is not proposed in this place to do more than indicate the general features of the modified system now adverted to. It was adopted by the board as proposed by the committee, and, as far as can be inferred from its operation, it is believed that with such improvements as practical experience may suggest, it will fully realize the advantages expected from it, and effect all the security of which the case is susceptible. It may be further observed that, although in the execution of the system the duties of some of the old agents were materially changed, and in some instances the employment of new ones was required; yet it has been so arranged as that by reducing the salary of those whose duties had been lessened, the aggregate expense of the whole is less than was paid under the system it superseded. The report of the chief engineer, hereto appended, will not only disclose the present working of the system so far as tested by practical experience, but also contains in addition a general professional exposition by that officer, of the state of the road and machinery and of the working and operation during the year; and by its statements on these points will dispense with further observations in this report upon the same topics.

#### SECOND—OF THE WASHINGTON ROAD.

The affairs of the Washington road are shown by the statements D. and E.

It will appear from these statements that there has been a falling off in the receipts from this road, and that the diminution has been in the passenger traffic. During the past year the number of passengers has been five thousand four hundred & three less than in the year 1846, and the amount of revenue received from this source has been eleven thousand eight hundred and nineteen dollars less than in the preceding year. It may also be stated that during the past year there was an increase in tonnage transportation of 3,100 tons, and of \$2,198 87 in the revenue from that source over the year 1846. It may be inferred, therefore, that the experiment of a reduced charge authorized by the board in the years 1845-6, has not realized the expectations by which it was recommended; and the conclusion would seem to be warranted that the lowest charges do not uniformly increase the amount of travel.

It will, therefore, become the duty of the board to reconsider the subject with the benefit of the experience they have already had, and to make such addition to the present charges as a full investigation may be found to authorize. The net profits from the Washington road, including the surplus of \$6,724 19 remaining after the dividend in April last amount to the sum of \$45,131 66, of which the board have declared a further dividend for the last six months of \$2 50 upon each share of stock, leaving a surplus of \$6,881 66

to be carried to the account of the current year.

To be Continued.

#### Railway Accidents in Great Britain.

We find in the London Mining Journal of Sept. 25th, the following summary of railway accidents, during the six months ending June 30th, 1947. The proportion is greater, it seems to us, than heretofore,—being one death in 22,000 passenger carried, if we include the deaths occurring among the people employed upon the roads, and by the companies—but only one passenger in 1,050,930 carried.

In a Parliamentary return, presented to both Houses by command of her Majesty, respecting the number and nature of the injuries to life and limb which have occurred on the railways in Great Britain and Ireland, from the 1st of January to the 30th of June, 1847, as reported by the various railway companies to the Commissioners of Railways, minute details are given, by analysis, of the returns recorded in the office of the Commissioners of Railways—Duncan McGregor, Registrar.—It appears that of the 101 persons killed and 100 injured, on all the railways in Great Britain and Ireland, during the six months ending the 30th of June, 1847, there were—

14 Passengers killed, and 49 injured, from causes beyond their own control.

8 Passengers killed, and 3 injured, owing to their own misconduct, or want of caution.

8 Servants of companies killed, and 17 injured, from causes beyond their own control.

61 Servants of companies killed, and 21 injured, owing to want of caution, or recklessness.

10 Trespassers killed, and 7 injured.

1 Person killed, and 1 injured, while crossing the railway at the level crossings, owing to misconduct of servants of the company.

And for the same period, the number of passengers amounted to 23,119,412.

#### Speed and Power of Locomotives on the Narrow Gauge.

The following account of the performance of the Locomotives—"London" and "Snake"—is given by the London Herald of Sept. 1st. It shows that there has really been some improvement in Locomotive Engines since October, 1829,—when those allowed to compete, on the Liverpool and Manchester Railroad, for the prize of £500, were not to exceed five tons in weight, and were required to haul twenty tons, on a level road at the rate of ten miles an hour!!

Who will fix the limit of performance for the Locomotives built at the expiration of another period of eighteen years—or in the year 1865?

During Monday and Tuesday, (says the London Herald,) we availed ourselves, through the courtesy of Mr. Creed, the Secretary, and Capt. Huish, the general manager of the London and North Western Company, of several opportunities of witnessing the workings of Crampton's engine, the *London*, and Stephenson's engine, the *Snake*. The results prove that we were correct in stating, that the narrow-gauge engines are having their capacity for speed and power slowly, but steadily, increased.

On Monday we took a trip down with the

*Snake*, which was attached to the 10 o'clock morning mail train—down also with the *London*, which was attached to the 5:30 afternoon stopping train, and up from Wolverton in the evening, with the same engine attached to the night express train. Yesterday morning we again went down with the 10 o'clock mail express, taken, as on the previous morning, by the *Snake*, and in the afternoon with the *London*, which was coupled to the 5 o'clock express train.

It was understood, on the Saturday, that the two engines were to take the 10 o'clock morning mail express down to Wolverton on alternate days; but it was subsequently considered, that it would be the fairer way to make the *London* work trains similar to those that had been previously taken by the *Snake*. The result of this determination was, that the *Snake* worked the morning express mail on Monday and yesterday, but the order for her to take out the train on Monday reached those in authority at the Camden Town station at an hour that gave the driver scarcely time to get his engine in the best possible order. She came down the Camden Town incline, it is true, with hot water in her tender, but not quite so hot as could be desired in what might be termed an experimental trip. The train on Monday morning was late, and a slight side wind prevailed throughout the trip to Wolverton. The following is the working in detail. The load taken was 11 carriages, or about 55 tons. It is to be recollected, that, for nearly the whole distance to Tring, 32 miles, the line rises above 10 feet per mile.

Arrived at Tring 10 h. 59 m. 12 s.

The remainder of the journey to Wolverton, over a falling gradient, was performed at an average running velocity—that is, when the engine had got into full work, of about 47½ miles per hour.

The next trip was with the *London*, which took down 15 carriages, or about 75 tons. The train was a stopping one, and the driver was required merely to keep his time at the stations. This he did within a few seconds.

Between the 35th and 39th mile-posts, the driver appeared to have put on something like the power of the engine, and we noticed the work to be as follows:—

Mile posts.	h. m. s.	Time per mile.	Miles per hour.
35	6 43.04	0.00	00.0
36	0.44.16	1.08	52.9
37	0.45.21	1.06	55.4
38	0.46.25	1.04	56.3
39	0.47.35	1.05	55.3

The return trip with the *London*, with the night express, was, excepting the down working made by her yesterday, when attached to the five o'clock express, the best we have ever witnessed on a narrow gauge. The train consisted of ten carriages, weighing about 50 tons, exclusive of the engine and tender. The tender is a very capacious one, and was originally intended to carry sufficient water for a train to run to Rugby (83 miles) without stopping. It weighs 20 tons, or between 5 and 6 tons more than is necessary, so that the engine may be fairly said to have taken a train of 11 carriages, or 55 tons.

The train should have started at 9:30, but did not leave Wolverton till 9:46:30, or 16½ minutes after time. We arrived at Tring, about 21 miles from Wolverton, at 10 h. 14 m. 5 s., and made a stoppage there of 4 m. 15 s. Between Tring and Walford, we occasionally caught sight of the mile-posts, and found that the speed was from 62 to 64 miles per hour. On emerging slowly from the Primrose hill tunnel, the driver had the red signal against him, and he brought his train to a state of rest about 150 yards on the tunnel side of the Chalk Farm bridge, at 10:52:5, having run about 30 miles in 33 m. 45 s., including the time lost in getting up speed when departing from Tring, and in running slowly through the Primrose-hill tunnel, and coming to a state of rest. The average speed, over about 28 of these 30 miles, was 60 miles per hour.

The morning mail, taken down yesterday by the *Snake*, consisted of 14 carriages, weighing about 70 tons. The average speed, from the 4th to the 31st mile-post, was about 41 miles per hour.

The best trip yet made on the narrow gauge, was the *London*, with the 5 o'clock express train on Tuesday afternoon. It consisted of eight carriages, weighing 40 tons. We went down with Captain Huish, who was evidently much gratified with the high and regular speed maintained over the heavier gradients between Euston-square and Tring. The train, though weighing 40 tons, may be fairly estimated at 45 or 47 tons, when we bear in mind the perfectly unnecessary addition of some 5 to 7 tons weight of Mr. Crampton's tender. The train left Euston-square at 5 h. 1 m. 45 s., and performed the first 4 miles in 6 m. 14 s. The 5th mile, which is partly on a rise of 1 to 603, and partly on a level, was gone over at the rate of 49.3 miles per hour. The 6th mile is on a level, and was done at the rate of 51.4 miles per hour. The 7th is on a falling gradient of 1 in 1606, and this was gone over at nearly 54 miles per hour. We have then a rising gradient of 1 in 341, for up-

wards of 5 miles, and over this the working was as follows:—

Mile posts.	h. m. s.	Time per mile.	Miles per hour.
7.....	0.11.29	0.0	0.0
8.....	0.12.37	1.8	52.9
9.....	0.13.46	1.9	52.2

At Leighton the red signal was against the driver, who brought the train slowly up. About a minute more than the usual time was lost in doing this. The *London* had gained about 10 minutes, and it was found that a luggage train was ahead. This occasioned a stoppage 8 min. 15 sec. at Leighton. The working of the engine from Leighton was—

52.....	0.00	0.00	00.0

Arrived at Wolverton.....6.15.8.

This shows the 31½ miles over the heavy gradients to Tring to have been done, including the time lost in getting up speed, running up the Camden Town incline, and in coming to a state of rest at Tring, in 38 min. 11 sec., or at an average velocity from station to station of 50 miles per hour. Deducting the 2 min. 2 sec. lost at Tring, and the 8 min. 15 sec. at Leighton, the running time was 1 hour 2 min. 6 sec. for the 52½ miles. But the *London* would have done better even than this, had she not been obliged to run with great caution over some portions of the line between Tring and Leighton, where large numbers of laborers are engaged on the permanent way. Mr. Maddigan, of the London and North-Western

Company, and M. Audibert, one of the engineers of the French Government, rode on the engine, and both expressed themselves in high terms of its great steadiness at its highest velocity. We have no doubt that some one of the new narrow-gauge engines, now in the course of construction, will equal the workings we have given above of the *London*, but we question whether they will be quite so free from jumping, and unpleasant, not to say dangerous, oscillation. If the road to Wolverton were clear, Crampton's engine, would, we think, take 50 tons over the 53 miles in from 58 to 60 minutes!

We should like to see the *London* take the 10 o'clock morning express mail with a load similar to that taken by the *Snake* on the 28th of August—viz., 14 carriages. We think the *London* would find it a difficult matter to perform a better average working—we question whether she would equal the average then maintained with 70 tons. The *Snake*, on that occasion, maintained an average velocity of between 45 and 40 miles per hour from the 4th to the 31st post—a first rate working, with a 15-inch cylinder, and up an average rising gradient of about 14 or 16 feet per mile.

#### Atmospherical Railway on a New Plan.

The following description is taken from the London Mining Journal, and is given by the Editor, as the result of his own observation, or we might pass it by as one of the many schemes put forth by ingenious men, more useful in theory than in practice—but as he was much better able to understand it from the working model than from the drawing; so may we be, when we see it at work, than we are now after reading his description of it. It may, however, be more readily understood by our readers and we therefore lay it before them.

**Novel Mode of Pneumatic Railway Transit.**—We have during the week, had an opportunity of inspecting a model, descriptive of a novel mode of propelling carriages on railways, which, although in the specification and diagrams we had previously seen appeared complex, and even, as we considered, perfectly "utopian," does, we must confess, show a very different complexion when thoroughly investigated and the model seen in action. The principle, though dependent on the power of the atmosphere, must not be classed with any of the previously-described plans—all of which, more or less, are based on the longitudinal opening system; the merits and superiority of which, of course, lie in the best method of obtaining a perfect close joint, and which has, doubtless, been most successfully accomplished by Clarke and Varley, in their very perfect and simple arrangements, which we have so often described and remarked upon, on previous occasions; and which, we still feel confident, are capable of doing all which we have ever given credit for, and all the patentees ever claimed for their elastic tube system. The great object of the inventors of the system under notice has been, to mature a plan for superseding the expensive and dangerous locomotive engine, by substituting one which, while it combines great speed, little friction, perfect safety, and every detail connected with it un-

der the most complete command, should be capable of embodying the whole force of the moving power in the propulsion of the train; and thus establishing a system of economy, which the most earnest supporters of the locomotive engine could never dream of.—How far they have succeeded will be best judged of by an inspection of the model and drawings; to us, it certainly appears that they have obtained, in a most eminent degree, all those great essentials to railway transit, and that their plan is another link in the chain by which the mind is bound to the opinion, that "railways are yet in their infancy." In attempting a description of this ingenious contrivance, we would first observe, that the principle is absolutely that of the locomotive reversed, inasmuch that, instead of the engine acting directly on the driving wheels, and thus requiring an enormous amount of weight, and consequent friction to obtain the necessary grip, or bite, on the rail, they have made the driving wheels stationary, and placed them in such situations, that they take hold of the train as it advances; and, however absurd it may appear, without investigation, we have no hesitation in saying that, on a line in good condition, from London to Birmingham, with four stationary steam-engines of moderate power, a train once started, would arrive safe at its journey's end without further human intervention—it being, in fact, the absolute agent of its own motion, although not the prime mover.

The model, which is now open for public inspection, is a circular platform, 14 ft. in diameter, on which are laid a double line of rails of about 7½ in. gauge, or on a scale of one-eighth, or 1½ in. to the foot, compared with a proper working line; the carriages, and every part of the model are, of course, in the same proportion. Around the inner circle of this platform is laid a pipe of three-quarters of an inch in diameter, which is carried down to the basement story of the house, where it is connected with a pair of air-pumps, worked by a small steam-engine, which, when in operation, keeps up continually sufficient vacuum for the purpose of propelling the trains. It is in this continuous vacuum that the whole principle and its novelty consist.

Before proceeding further, we will endeavor to make our readers acquainted with what the patentees call an *air-engine*; but which we think would with much more propriety be termed a *vacuum-engine*. It consists of a cylinder, with piston and double-action valves, precisely similar to those of a high-pressure steam-engine, but of the greatest simplicity, as a crank and pulley, attached to the top of the piston-rod, is all the machinery connected with them. A pair of these is placed at three different points on the model, which represent 100 yards between each in actual practice, or 18 pair to the mile; they are placed in connexion with the vacuum tube, and, by opening a valve, are immediately set in motion by the external pressure of the atmosphere on the piston.—Between each pair of vacuum-engines are placed three horizontal wheels—one on each

side, and one in the centre—all three being connected, and put simultaneously in motion by the engines already described, of such dimensions, that their peripheries range are exactly even with the rails; the valves for connecting, or cutting off, the passage from the vacuum tube to the side engines, are regulated by levers, on the end of which are small friction rollers; and at stations there will also be an arrangement for regulating by an attendant in addition. Along the whole line of carriages outside the wheels, are placed wooden rails, connected by tubes, passing under the carriages, in which tubes are spiral springs; and, by a longitudinal bar passing under every carriage, and connected together, the guard can, by a screw lever in the front, with the greatest facility, increase or lessen the distance between these wood rails. This part of the invention is highly ingenious, and of the utmost importance to the principle; but can hardly be explained without a drawing. The rails are on a level with the horizontal wheels.

At the termini, it is proposed to have two pairs of vacuum engines, to give a greater momentum at starting. The *modus operandi* is as follows:—We will suppose the guard carriage of a train to be placed between the first set of horizontal wheels at the terminus of a railway—the steam engine regularly working—sufficient vacuum obtained, and the word given "all right," the attendant immediately opens the communication to the vacuum engines, which immediately set the horizontal wheels in motion, and the train is propelled by the tight grip which the horizontal wheels have on the side rails of the carriages, with sufficient momentum, let it be ever so short to carry it to the next pair of vacuum engines. The ends of these side rails are so arranged, that they form incline planes, and then pass on to the friction rollers, and press down the levers, which open the communication with the vacuum engines; these immediately set in motion their set of wheels, give fresh momentum to the train, which rushes on to the next pair, and so on throughout the line; an incline plane on the rails of the last carriage presses down each lever of the vacuum engines after they have done their work, and cuts off the communication. When the guard wants to go slow, or stop, he has only to contract the wooden rails, when the grip on the horizontal wheels being taken off, the motion slackens, and by putting on his break he stops. During the experiments we witnessed, the mercury generally indicated a pressure of about 5 lbs. on the inch.

One great advantage exists, that by the motion of a lever at a station, which reverses the action of the horizontal wheels, trains can be backed with the greatest facility. On a railway it is proposed to have a copper tube, of about 10 lbs. weight to the yard, and corrugated at certain distances to give it strength, which will be laid under ground, outside of the rails, the entire length of the line, and, of course, connected at every hundred yards with the vacuum engines. It will be seen that, by employing a close tube, sim-

ilar to a gas pipe, no leakage can occur from a defective longitudinal valve; and, as the number of the strokes of the pistons of the vacuum engines will always be in proportion to the length of the train, the interruption to the vacuum, and the only one, can be calculated to a nicety. Another fact, and a curious one, in connection with this system is, that no matter how long, or how short a train, there will always be a proportional amount of power for its propulsion—for, whether 20 or 90 yards long, it will receive sufficient momentum to be carried to the next propellers; if a little above 200 yards, it will have three pair in action at once; and, if even a mile long, it would then have 18 pairs. Here, also, there is no piston in the tube, or work hidden from sight, and difficult to get at in case of repairs. An injury to one vacuum engine is of no consequence, as each move a whole set of horizontal wheels; and, as a stock of every material would, of course, be kept in duplicate, another engine would be clapped on, and the injured one moved to the workshop for repair. With respect to expense, it might, at first sight, appear, that the system was complex, and, consequently, only to be established at great cost—when, however, it is remembered that very light rails would be amply sufficient, that the copper tube could be obtained at about 10s. per yard, the vacuum engines and horizontal wheels, being simple and inexpensive, and made in large numbers, would not be costly, and that few and small steam engines would do all that could be required, it will be seen that a line on this system could be laid down on very economical terms; in fact, the patentees, Messrs. Cunningham and Carter, would undertake to lay down a double line of rails, with every item prepared for the running of the trains, for 4000l. per mile.

#### CRADDOCK'S IMPROVED LOCOMOTIVES & STATIONARY ENGINES.

We find in the Mining Journal, for September 18th, the following remarks—accompanied by a cut of a locomotive—in relation to improvements said to have been made by Mr. Craddock upon the steam engine. We omit the cut, and the paragraph describing it more particularly, and give now only such portions as speak of it in general terms—but may hereafter, when we hear more of it, give the cut and details.

**Craddock's Patent Universal Condensing Steam Engine.**—We have, on former occasions, noticed several improvements in the steam engine, patented by Mr. Thos. Craddock, of Birmingham, and we have now before us a pamphlet, descriptive of some further patented arrangements, by which the whole is much simplified, and rendered more available and economical. They are illustrated by 10 elaborately detailed diagrams, showing how the entire improvements may be rendered available to every kind of engine—stationary, marine or locomotive. It may be remembered, that the principal part of Mr. Craddock's improvements consists in his mode of condensing the steam, and returning the water to the boiler—thus causing a continual and freer circulation between it and the en-

gine; and for situations, in particular, where water is scarce, the importance of this circumstance alone must be appreciated by every engineer. The patentee calculates that a forty-horse power engine can be worked with 20 gallons of water, while the non-condensing engine requires 4000 gallons per day; the Cornish engines, 16,800, and a Boulton and Watt engine, of the same power, for steam and condensation, 78,400 gallons per day.—The leading features of the system it will be seen, are—the furnishing the means requisite to the fullest development of the expansive powers of steam, and enabling it to be condensed, in all situations, by water, where it is obtainable, and, where not attainable, by the atmosphere; in short, a modification of Wolff's engine—combining, in every shape, simplicity, compactness, and an extraordinary degree of economy. The diagram, at the head of this article, is descriptive of the application of the air condenser to a locomotive engine, with angular set cylinders, and the two connecting rods taking hold of one driving wheel on each side. The condenser is seen in front and consists of a number of vertical tubes, formed by connecting plates, at top and bottom, into one whole cylinder; this is made to revolve at a rapid rate, and thus presents every part of the tubular surface to continually-changing and fresh currents of cold air, by which rapid condensation takes place.—The steam is admitted at the top of the condenser, and, as the water from the condensed steam falls to the bottom, it is taken up by a small pump, and forced into the boiler—scarcely any waste thus taking place, and securing the extraordinary results above mentioned.

There is, of course, in this, as in the locomotive engine we have described, a high and a low pressure cylinder. The steam is employed by Mr. Craddock at 100 pounds pressure to the inch, and then expanded to six times its volume before condensation—the steam chest, boiler and apparatus, being made proportionally strong; and on this highly important point we cannot do better than give the inventor's own words. He says:—"But here comes that bug-bear, which has so long frightened mankind from a dispassionate use of steam at such pressure—viz: its danger. It is high time that scientific men should, at least, grapple with this delusion, and calmly consider whether, with such boilers as are here submitted, such pressure is not only as safe as the pressure now used in the common boilers, but very much safer than any, even low pressure boilers—while it is demonstrable that 1lb. of coal will produce sevenfold the mechanical effect to that which would result was the steam used without expansion." After minutely describing the whole 10 diagrams, containing various descriptions of engines, with his improved steam valve, with and without steam box, air pump, and stop off valve, which we cannot clearly demonstrate without the diagrams, which are too numerous for our columns, Mr. Craddock gives a series of six tables, illustrative of the economy and large amount of power obtained by working the steam expansively on the high

pressure system. The results brought out are startling—showing, in marine engines, a saving of fuel per 1000-horse power per annum, supposing eight voyages to be made, in that period between Liverpool and New York, of 7052 tons, and a further saving, in pounds sterling, from increased tonnage, for merchandise, of £49,200 per annum—making a total saving, per 1000 horse power per annum, of £57,649, and per 100,000-horse power, for the like period, of £5,764,900. In locomotive engines the saving would be enormous. Mr. Craddock calculates that the saving effected on £346,800, being the cost of coke on the railways open in 1845, would amount to £286,487, or 82½ per cent., and on the whole locomotive expenses, 20 per cent. This would give an increased available dividend of 15s. on every £5; and, if to this be added the increased economy generally, which would arise from the use of the system, the saving would increase the value of such railway property *one fifth*! These results, if founded on practice, are most important to capitalists, shareholders, and all connected with the steam engine; and as Mr. Craddock has, for a number of years, devoted his energies to the principles and improvement of its machinery in general, we have no reason to doubt the correctness of his conclusions. The pamphlet should be in the hands of every engineer.

#### A New Rotary Steam Engine.

We visited the new Steam-Engine known as Schenck's Rotary, now in operation at "the Archimedes Works" of Dunham & Browning, in North-moore near Washington. The Engine was regularly at work driving powerful machinery, and, though built for twenty-five, is found to be practically of forty-horse power. To say that any invention is perfect would be rash; but, having seen this operation in various ways beside that in which it was regularly employed, we are convinced that it possesses these advantages over the ordinary engine:

1. The Rotary motion is original and complete, without any waste of power or possibility of interruption like the "stopping on the centre" well known to all who work with steam.

2. This Engine occupies not more than one-third the room required by the old ones.

3. It is less than half the weight of an ordinary engine of equal power—a vital consideration in steamboats, on railroads, etc.

4. It requires much less fuel—a fact of great importance in view especially of the rapid extension and increase of Ocean Steam Navigation.

5. It costs considerably less money than any other engine of equal capacity.

This last is a circumstance quite adverse to what is usual. Generally, when a machine is invented to save labor or fuel, or to increase power, it must encounter the drawbacks of increased cost. Manufacturers and operators of machinery are weary of looking at inventions, which promise to save them so many hundred dollars per year, but require an immediate outlay of perhaps thousands to effect it. But here is an invention which

economises not only in future but first cost, giving treble power from the same weight of metal and on the same area of space, while you have less to pay for it than for any other of equal force. There can be little doubt that it will rapidly supersede all others; indeed, we cannot see why an old-fashioned Engine should ever more be ordered or constructed by one who has examined this.

We cannot describe this engine so that it shall be understood without diagrams by the reader. It consists in good part of a moving cylinder inside of a stationary one, the steam passing into the former and being employed to turn the latter by means of great simplicity and directness, so as to effect an immense saving of contrivances and gim cracks hitherto found necessary to convert the straightforward pressure of the steam into the momentum of a rotary motion. All persons interested in Manufactures or Machinery, or who expect to be so, should examine this Engine without loss of time.—*Artisan.*

*Delaware, Lehigh, Schuylkill and Susquehanna Railroad Company.*—This company, pursuant to the directions of the act of assembly, held an election for officers on Thursday, the 21st inst., in Easton, which resulted as follows: President, James M. Porter.—Managers, Dudley S. Gregory, John S. Darrey, John P. Jackson, Daniel McIntyre, John N. Hutchinson, and Edward R. Hiddle.—Treasurer, Robert L. Schuyler. Secretary, John N. Hutchinson.—*N. A. & U. S. Gaz.*

**GILLESPIE'S WORK ON ROAD MAKING.**  
A Manual of the Principles and Practice of Road making, comprising the Location, Construction and Improvement of Roads, (Common, Macadamized, Paved, etc.), and Rail Roads, by W. M. Gillespie, Professor of Civil Engineering in Union College. Published by A. S. BARNES & CO., 51 John St., New York.

LINDSAY & BLAKISTON } Philadelphia.  
GRIGG, ELLIOT & CO., }

#### RECOMMENDATION FROM PROFESSOR MAHAN.

"I have very carefully looked over Professor Gillespie's Manual of Road Making. It is, in all respects, the best work on this subject with which I am acquainted; being, from its arrangement, comprehensiveness and clearness, equally adapted to the wants of Students of Civil Engineering, and the purposes of persons in any way engaged in the construction or supervision of roads. The appearance of such a work, 30 years earlier, would have been a truly national benefit, and it is to be hoped that its introduction into our seminaries may be so general as to make a knowledge of the principles and practice of this branch of engineering, as popular as is its importance to all classes of the community.

(Signed,) D. H. MAHAN,  
Professor of Civil Engineering in the Military  
Academy of the United States."

**TO RAILROAD CAR BUILDERS.**  
SEALED PROPOSALS will be received by the undersigned up to SATURDAY, the 6th of November, inclusive, for the construction of 30 HOUSE CARS, for freight, 2 BAGGAGE CARS and 2 MAIL CARS, according to plans and specifications which will be furnished, and for which proposers are referred to the Master of Machinery, at the Company's Mount Clare Depot, Baltimore, who will be prepared to exhibit them on and after the 25th current.

The House Cars to be delivered by the 1st of February, 1849; the Baggage Cars by the 1st of December, and the Mail Cars by the 15th of December next. BENJ. H. LATROBE, Chief Eng. & Gen. Supt. Baltimore and Ohio Railroad.  
Office No. 23 Hanover St., Baltimore.

**TO LOCOMOTIVE ENGINE BUILDERS.**  
Proposals under seal will be received by the undersigned up to SATURDAY, the 6th of November, inclusive, for furnishing the Baltimore & Ohio Railroad Co. with 4 LOCOMOTIVE ENGINES, in conformity with the following specification:—

1. The weight not to exceed 20 tons, of 2240 lbs., and to come as near to that limit as possible.
2. The weight to be uniformly distributed upon all the wheels, when the engine is drawing her heaviest load.
3. The number of wheels to be eight.
4. The diameter of the wheels to be 43 inches.
5. The four intermediate wheels to be without flanges.
6. The boiler to contain not less than 1000 square feet of fire surface, of which there shall be not less than one-fifteenth in the fire box.
7. The tubes of No. 11 flue iron, with not less than ¼ of an inch space between them in the tube sheets.
8. The fire box with the exception of the tube and crown sheets to be of ¾ inch copper.
9. The tube sheets to be 1 inch thick.
10. The boiler to be of No. 3 iron, of the best quality.
11. The fire box to be not less than 24 inches deep below the cylindrical part of the boiler.
12. The steam to be taken to the cylinder from a separate dome on the fore part of the boiler.
13. The frame, including the pedestals, to be entirely of wrought iron, and the boiler to be connected therewith, so as to allow of contraction and expansion without strain on either.
14. The cylinders to be 22 inches stroke, and not less than 17 inches diameter.
15. The cut off to be effected by a double valve, worked by separate eccentricities.
16. The angle of the cylinder to be not greater than 13½ degrees with the horizontal line.
17. The frame and bearings to be inside the wheels and the direction from the cylinder direct with the back pair of intermediate wheels.
18. The centres of the extreme wheels to be not more than 11½ feet apart.
19. The wheels to be of cast iron with chilled tire.
20. The means to be provided of varying the power of the exhaust in the blast pipe.
21. The engine to be warranted to do full work with Cumberland or other bituminous coal, in a raw state, as the fuel—and the furnace to be provided with an upper and lower fire door with that view.
22. The smoke stack to be provided with a wire gauze covering.
23. Two safety valves to be placed upon the boiler, each containing not less than 5 square inches of surface and one to be out of the reach of the engine-man.
24. The tender to be upon 8 wheels and constructed upon such plan as shall be furnished by the company, and to carry not less than 3 cords of wood or its equivalent in coal, and 1500 gallons of water.
25. The materials and workmanship to be of the best quality, and the engine to be subjected to a trial of 30 days steady work with freight upon the road, before acceptance by the company.

Payment to be made in cash on the acceptance of the engine. The four engines to be delivered at the company's Mount Clare depot, in Baltimore—the first on the 1st of February, 1849, and the three others on the 1st of March, April and May, ensuing.

The track is 4 feet 8½ inches gauge, and the shortest curve of the road is 400 feet radius. The company to be secured against all patent claims.

Further information will be communicated upon application to the undersigned, at the company's office, No. 23 Hanover street, Baltimore, to which the proposals suitably endorsed will be addressed. By order of the President and Directors,  
BENJ. H. LATROBE,  
Chief Engineer and General Superintendent.  
Baltimore, Sept. 18th, 1847.

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to  
FULLER & BROWN, Agents,  
No. 139 Greenwich, corner of Cedar street.  
June 4, 1847.

1046

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.**  
Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.  
Hamilton, July 30, 1817. 3m32

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 1 in calibre and 2 to 19 feet long, capable of sustaining pressure from 600 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse B. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**SPRING STEEL FOR LOCOMOTIVES,**  
Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1 1/2 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
1y Albany Iron and Nail Works,

**RAILROAD IRON.—400 TONS ENGLISH,**  
60 pounds per lineal yard, of best manufacture, and expected to arrive about 1st October by London packets. Apply to

DAVIS, BROOKS & CO.,  
1m37 68 Broad Street, New York.

**FOR SALE—300 TONS (10 MILES) FLAT**  
Bar Rail, in parcels or wholesale—section 2 1/2 inches wide by 3/4 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
1m37 Wilmington, Del.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

**PASSENGERS, SPECIE, GOODS, PARCELS, &c.**  
To all parts of the United States, North and South America, West Indies, India, [overland or otherwise.] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m ROBERT GRACIE.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 322 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.  
ja45

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tilters &c., by  
JOHN A. ROEBLING, Civil Engineer,  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.  
92v117

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinkley & Drury, Boston, will be promptly executed. FRENCH & BAIRD.

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.  
Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

ROGERS, KETCHUM & GROSVENOR,  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trestles are 5 feet from centre to centre, while in the new construction they are only 3 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trestles, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trestle for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,324 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = \$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,350 lbs. at 4 1/2 cts =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**  
Civil Engineer and Patentee.  
No. 277 South Third St., Philadelphia. 321f

### LAP-WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

23 Platt street, New York.

### RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address **J. M. HOWE,**

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

**ENGINEERS' AND SURVEYERS'**  
**INSTRUMENTS MADE BY**  
**EDMUND DRAPER,**  
Surviving partner of

Philadelphia.

road Depots, etc.

**ANDREW MENEELY.**

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**  
124f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY Iron Company," Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,** Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floods and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by **JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Seor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**

75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LB. OZ.	INCH.	LB. OZ.		LB.	INCH.	Tons.
11	4	13 5	10	21 -	50	15-16		20
13	3	9 3	8	16 -	27	11-16		13

16	2	4 3	6	8 8	10	7-16		7

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron; all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLCOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

1y25

Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

1y25

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,]

T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,]

JOHN LEACH,

Jamaica November 12, 1845.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel;

Junia rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,** 245 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS:** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

Philadelphia.  
**ROBERT NICHOLS, Agent,**  
No. 79 Water St., New York. 261f

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own condition of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 119 Fulton street, New York. 281f

**J. BALL & CO.**

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between the two roads, will run as follows, viz: Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**PATERSON RAILROAD** Summer Arrangement. Commencing April 20th, 1847, the cars will leave Paterson at New York at 8 o'clock a.m. 9 1/2 o'clock a.m. 11 1/2 o'clock a.m. 12 1-4 o'clock p.m. 4 o'clock p.m. 5 1/2 o'clock p.m. On Sunday. 8 o'clock a.m. 9 1/2 o'clock a.m. 4 o'clock p.m. 5 1/2 o'clock p.m. Office 75 Courtlandt St. 251f

**BALTIMORE AND OHIO RAILROAD.**  
**MAIN STEM.** The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 26 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 19 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13½

**LITTLE MIAMI RAILROAD COMPANY.**  
Fall and Winter Arrangement, 1847. On and after Monday, September 20th,

until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Millford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Yellow Springs, and Springfield. Returning, will leave Springfield at 4½ a.m. Upward train arrives at Cincinnati at 2½ p.m. Downward train arrives at Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore & Co. are running the following stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheeling, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanesville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine & the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, in 32 hours. Distance from Cincinnati to Springfield by railroad.....81 miles.

From Springfield to Bellefontaine by stage, over a good Summer road.....33 "

From Bellefontaine to Sandusky city by railroad.....103 "

**FARE**—From Cincinnati to Lebanon.....\$1 00  
" " " Xenia.....1 50  
" " " Springfield.....2 00  
" " " Columbus.....4 00  
" " " Sandusky city 7 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at a package for every \$500 in value over that amount.

W. H. CLEMENT, Sup't.

**BALTIMORE AND SUSQUEHANNA**  
Railroad.—Reduction of Fare. Morning and Afternoon Trains between Balti-

more and York.—The Passenger trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....5 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.  
Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**

Fare to York.....\$1 50  
" Wrightsville.....2 00  
" Columbia.....2 12½

Way points in proportion.

**PITTSBURGH, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburg via stage to Harrisburg.....\$9  
Or via Lancaster by railroad.....10  
Through tickets to Harrisburg or Gettysburg... 3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owing's Mill, arriving at the Mills at.....5½ p.m.  
Returning, leaves Owing's Mills at.....7 a.m.  
D. C. H. BORDLEY, Sup't.  
Ticket Office, 63 North st.

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 28 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35½

**CENTRAL AND MACON AND WESTERN**  
Railroads, Ga.—These Roads with the Western and Atlantic Railroad

of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad.....190 Miles.  
Macon to Atlanta—Macon and Western.....101  
Atlanta to Oothcaloga—Western and Atlantic... 80  
Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50	0 62½

On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20 pr. 100lbs. 35	
Crockery, per cubic foot.....	0 15 "	35
Molasses and Oil, per hhd., (smaller casks in proportion). 9 00		12 50
Ploughs, (large), Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95

Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846.

**CENTRAL RAILROAD—FROM SAVANNAH**  
to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—

On weight goods generally... 50 cts. per hundred.  
On measurement goods.....13 cts. per cubic ft.  
On brls. wet (except molasses and oil).....\$1 50 per barrel.

On brls. dry (except lime)... 80 cts. per barrel.

On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred.

On molasses and oil.....\$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Supt. Transportation.

**SOUTH CAROLINA RAILROAD.—A**  
Passenger Train runs daily from Charleston,

on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tuscumbia..... 22 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**  
Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1½

**NEW YORK AND PHILADELPHIA**  
Railroad line—direct. Via Newark, New Brun-

wick, Princeton, Trenton, and Bristol. (Through in

six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.

Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars..... 3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily except Sundays, at 8 a.m., 3½ and 10 p.m., and Saturdays only at 10 p.m.—being a continuation of the line from New York.

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville,	93	\$3.50 and \$3.00	
" " Reading,	58	2.25 and 1.90	
" " Pottsville	34	1.40 and 1.20	

Five minutes allowed at Reading; and three at other way stations.

Passenger Depot in Philadelphia corner of Broad and Vine streets.

# PHILADELPHIA, WILMINGTON & BALTIMORE RAILROAD.—1847.

Summer Arrangement.

Philadelphia for Baltimore... 8 a.m. and 10 p.m.  
Baltimore for Philadelphia... 9 a.m. and 8 p.m.  
Connecting with Mail Lines North, South & West.

On Sundays, only the 10 P. M. Lines run.

The Boat Lines, via Newcastle & Frenchtown R.R. Leave Philadelphia at 3 p.m. No line on Sun. Leave Baltimore at 3 p.m. day.

Accommodation Trains between Philadelphia & Wilmington.—Philadelphia to Wilmington, 8 a.m., mail, 12 p.m., 4 p.m., 7 p.m., 10 p.m. mail. Wilmington to Philadelphia, 7 a.m., 1 p.m., mail, 4 p.m., 7 p.m., 12 a.m., night mail.

J. R. TRIMBLE,  
Engineer and General Superintendent.

# GEORGIA RAILROAD. FROM AUGUSTA TO ATLANTA—171 MILES.

AND WESTERN AND ATLANTIC RAILROAD FROM ATLANTA TO DALTON, 100 MILES.

This Road in connection with the South Carolina Railroad and Western and Atlantic Railroad now forms a continuous line, 408 miles in length, from Charleston to Dalton (Cross Plains) in Murray county, Ga.—32 miles from Chattanooga, Tenn.

## RATES OF FREIGHT.

	Between Augusta and Dalton.	Between Charleston and Dalton.
	271 miles.	408 miles.
1st class. Boxes of Hats, Bonnets, and Furniture, per cubic foot.....	\$0 18	\$0 28

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the Franklin House, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS:—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, November 6, 1847.

### Depot at Keene.

A superb building for a depot of the Cheshire Railroad is nearly completed at Keene, N. H. This road, from the Fitchburgh Road to Keene, is to be completed this year—and to Bellow's Falls early next year—or in time to meet the Rutland road, which we understand is progressing fairly.

### Vermont Central Railroad.

The Central Vermont Road from Hartford, or mouth of White River, Vt., is to be completed to Northfield, about fifty miles, early next season; and then, we presume, the Connecticut River Road, from Bellows' Falls to Hartford, thus connecting the Cheshire Road and the Central Vermont Road.

### Concord and Lebanon Railroad.

The Road from Lebanon, N. H., to Concord, will probably be completed early next year—when there will be an uninterrupted line from Boston to Northfield, Vt., and in a little time after it will be completed to Burlington.

### Rutland Railroad.

The Rutland Road may not be completed quite as soon as the Central, but it will probably not be far behind it in reaching Burlington.

### Connecticut and Passumpsic Railroad.

The Road, in continuation, from the mouth of White river to the mouth of the Passumpsic, will, we are quite sure, be pushed on with the least possible delay—and from thence in the direction of Canada line, the work is progressing rapidly. The energy and spirit evinced by the people of

New Hampshire and Vermont—since they have been aroused to the importance of railroads—is worthy of all praise.

### Another Railway Project in the West.

A public meeting has been held at Winchester, Randolph county, Indiana, to forward a Railway from Indianapolis to Bellefontaine, Ohio: Great interest was manifested in the proposed route, and the opinion was expressed that the citizens of Randolph county alone, were able without cramping themselves, to construct the road through their county. That is the way to get along—true go-aheadiveness.—*Cin. Gaz.*

### Pittsburg and Cleveland Railroad.

At the annual meeting of the stockholders of the Cleveland and Pittsburg railroad company, held in Wellsville on the 18th instant, the following named gentlemen were elected directors of the company for the ensuing year:

James Farmer, Salineville; Charles Knapp, Jr., Pittsburg; Samuel Williamson, Cleveland; Henry N. Day, Hudson; Cyrus Prentiss, Isaac N. Brayton, Ravenna; James Aien, Henry Cope, D. T. Lawson; John S. McIntosh, James Stewart, Alexander Wells, Wellsville.

The board organized by electing James Farmer, president; Cyrus Prentiss, treasurer; James Stewart, local treasurer; and A. G. Catlett, secretary.

The board resolved to put the grading, masonry, and preparing for superstructure of the whole line of road, from the point to which it is now let to Hudson, under contract as soon as the engineers can prepare it, passing through Freedom, Lima, Atwater and Ravenna, on a line as near that already surveyed as the interest of the company will permit.

We copy the above, says the Pittsburg Gazette, from the Wellsville Patriot, from which we also learn "that the whole line is to be put under contract as soon as the engineers can prepare it for letting to Hudson, a point within 24 miles of Cleveland. This remaining 24 miles seems to be allotted to the wealthy and flourishing city of Cleveland to make."

We took occasion, some weeks since to notice the determined progress of the company having the above road in charge. It is due to these gentlemen to say that they have worked against all possible discouragements. With full faith in their own enterprise, and a manly action to back it, they are going ahead with the determination of linking the Ohio with the

lakes. There is no such word as fail, when an enterprise is thus sustained. We wish the new directors all possible success, and hope and believe that their labors will be rewarded with good dividends, and the honor and respect of the country.

### Corrugated Car Wheels.

The New York Tribune made a small error in its report of premiums awarded by the American Institute to A. Whitney & Son for "Consolidated Water Wheel,"—and the Mining Journal fell into the same error in copying from the Tribune. The wheel referred to, and for which a premium was awarded, is of cast iron for railroad cars, and is termed "corrugated," from the wavy, or wrinkled, form of that part between the hub, and felloe, and tread of the wheel—instead of spokes, or a flat surface, as in most other cast iron wheels.

The first wheels of the kind that fell under our observation were upon the coal cars of the Reading railroad, but they were cast in two parts—by casting the wheel without the hub, and then casting the hub onto the other part—in order to obviate the difficulty of the unequal contraction of the iron, caused by the chill. In this way a wheel is made without the openings in the hub, and consequently cheaper than those with the zink and rings, which occasionally work loose and require repairs. From what we saw of the corrugated wheel—cast in two parts—we were apprehensive that there was not sufficient strength at the place of joining—though we were informed by those who had experience, that they were found to possess ample strength.
